Chapter 1 Introduction

1.1 Introduction

Congratulations on your purchase of this outstanding product: 4G IIoT RTU. For industrial IoT applications, AMIT 4G IIoT RTU is absolutely the right choice. With built-in world-class 4G module(*¹), you just need to insert SIM card from local mobile carrier to get to Internet. The redundant SIM design provides a more reliable WAN connection for critical applications.

Main Features:

- Provide 4G WAN connection.
- Support dual SIMs for the redundant wireless WAN connection.
- Provide one Ethernet port for comprehensive LAN connection.
- Equip 802.11b/g/n 1T1R wireless for simple WLAN connection.
- Provide one RS232/RS485 serial port for controlling legacy serial device, or Modbus devices.
- Support the robust remote or local management to monitor network.
- Designed by solid and easy-to-mount metal body for industrial IoT applications.

Before you install and use this product, please read this manual in detail for fully exploiting the functions of this product.

¹ IOG500-0T112 for LTE cat. 4.

4G IIoT RTU

1.2 Contents List

1.2.1 Package Contents

#Standard Package

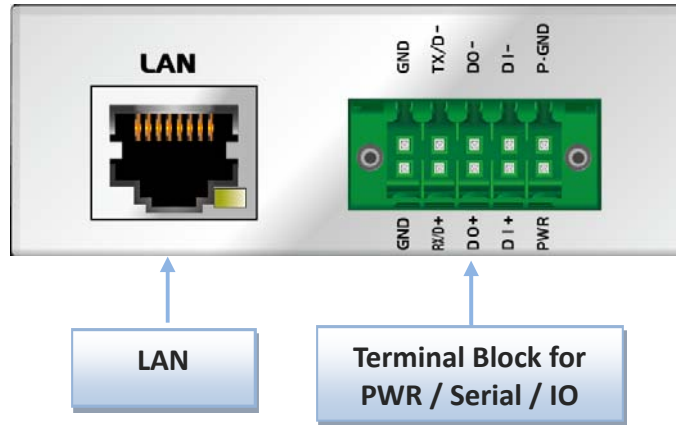

Items	Description	Contents	Quantity
1	IOG500-0T112 4G IIoT RTU		1pcs
2	Cellular Antenna		2pcs
3	WiFi Antenna		1pcs
4	Power Adapter (DC 12V/1A) (* ²)		1pcs
5	Terminal Block		1pcs
6	DIN-Rail Bracket		1set(2pcs)
7	RJ45 Cable		1pcs
8	Rubber Feet		4pcs

² The maximum power consumption of IOG500 series product is 5.5W.

4G IIoT RTU

1.3 Hardware Configuration

➤ Left View

➤ Right View

✳️Reset Button

The RESET button provides user with a quick and easy way to restore the default setting. Press the RESET button continuously for **12** seconds, and then release it. The device will restore to factory default settings.

4G IIoT RTU

1.4 LED Indication

Indication	LED Color	Description
Signal	Blue Purple Red	When the LED color is shown in: <ul style="list-style-type: none">• Blue: Cellular module is in LTE Mode.• Purple: Cellular module is in HSPA/3G Mode.• Red: Cellular module is in GSM/2G Mode. When the behavior of LED is: <ul style="list-style-type: none">• Flash (Fast): Signal Strength is 0~30%• Flash (Slow, per second): Signal Strength is 31~60%• Steady On: Signal Strength is 61~100%
WiFi	Blue	When the LED color is shown in: <ul style="list-style-type: none">• Blue: WiFi is enabled. When the behavior of LED is: <ul style="list-style-type: none">• Flash: When data transferred via WiFi LAN.
Serial	Blue	Flash: Data packet transferred via Serial port.
Status	Blue	Flash (per second): The gateway works normally. Flash (Fast): The gateway is in Recovery Mode or abnormal situation.

1.5 Installation & Maintenance Notice

1.5.1 SYSTEM REQUIREMENTS

Network Requirements	<ul style="list-style-type: none">• A fast Ethernet RJ45 cable• 3G/4G cellular service subscription• 10/100 Ethernet adapter on PC
Web-based Configuration Utility Requirements	<p>Computer with the following:</p> <ul style="list-style-type: none">• Windows®, Macintosh, or Linux-based operating system• An installed Ethernet adapter <p>Browser Requirements:</p> <ul style="list-style-type: none">• Internet Explorer 6.0 or higher• Chrome 2.0 or higher• Firefox 3.0 or higher• Safari 3.0 or higher

1.5.2 WARNING

Attention

- Only use the power adapter that comes with the package. Using a different voltage rating power adaptor is dangerous and may damage the product.
- Do not open or repair the case yourself. If the product is too hot, turn off the power immediately and have it repaired at a qualified service center.
- Place the product on a stable surface and avoid using this product and all accessories outdoors.

4G IIoT RTU

Federal Communication Commission Interference Statement

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

FOR PORTABLE DEVICE USAGE (<20m from body/SAR needed)

Radiation Exposure Statement:

The product comply with the FCC portable RF exposure limit set forth for an uncontrolled environment and are safe for intended operation as described in this manual. The further RF exposure reduction can be achieved if the product can be kept as far as possible from the user body or set the device to lower output power if such function is available.

FOR MOBILE DEVICE USAGE (>20cm/low power)

Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

FOR COUNTRY CODE SELECTION USAGE (WLAN DEVICES)

Note: The country code selection is for non-US model only and is not available to all US model. Per FCC regulation, all WiFi product marketed in US must fixed to US operation channels only.

1.5.3 HOT SURFACE CAUTION

CAUTION: The surface temperature for the metallic enclosure can be very high! Especially after operating for a long time, installed at a closed cabinet without air conditioning support, or in a high ambient temperature space.

DO NOT touch the hot surface with your fingers while servicing!!

4G IIoT RTU

1.5.4 Product Information for CE RED/LVD Requirements

The following product information is required to be presented in product User Manual for latest CE RED/LVD requirements.³

(1) Frequency Band & Maximum Power

1.a Frequency Band for Cellular Connection (for ME3630 E1C version)⁴

Band number	Operating Frequency	Max output power
LTE FDD BAND 1	Uplink: 1920-1980 MHz Downlink: 2110-2170 MHz	23 ±2.7 dBm
LTE FDD BAND 3	Uplink: 1710-1785 MHz Downlink: 1805-1880 MHz	
LTE FDD BAND 7	Uplink: 2500-2570 MHz Downlink: 2620-2690 MHz	
LTE FDD BAND 8	Uplink: 880-915 MHz Downlink: 925-960 MHz	
LTE FDD BAND 20	Uplink: 832-862 MHz Downlink: 791-821 MHz	
WCDMA BAND 1	Uplink: 1920-1980 MHz Downlink: 2110-2170 MHz	24 +1/-3 dBm
WCDMA BAND 8	Uplink: 880-915 MHz Downlink: 925-960 MHz	
E-GSM	Uplink: 880-915 MHz Downlink: 925-960 MHz	33 ±2 dBm
DCS	Uplink: 1710-1785 MHz Downlink: 1805-1880 MHz	30 ±2 dBm

1.b Frequency Band for Cellular Connection (for EC25-E version)

Band number	Operating Frequency	Max output power
LTE FDD BAND 1	Uplink: 1920-1980 MHz Downlink: 2110-2170 MHz	23.1 dBm
LTE FDD BAND 3	Uplink: 1710-1785 MHz Downlink: 1805-1880 MHz	23.0 dBm
LTE FDD BAND 7	Uplink: 2500-2570 MHz Downlink: 2620-2690 MHz	22.8 dBm
LTE FDD BAND 8	Uplink: 880-915 MHz Downlink: 925-960 MHz	23.2 dBm
LTE FDD BAND 20	Uplink: 832-862 MHz	23.5 dBm

³ The information presented in this section is ONLY valid for the EU/EFTA regional version. For those non-CE/EFTA versions, please refer to the corresponding product specification.

⁴ There can be different cellular module integrated in the device for EU/EFTA regional version. Refer to the cellular module identifier printed on the device label for the purchased device.

4G IIoT RTU

	Downlink: 791-821 MHz	
LTE FDD BAND 38	Uplink: 2570-2620 MHz Downlink: 2570-2620 MHz	21.7 dBm
LTE FDD BAND 40	Uplink: 2300-2400 MHz Downlink: 2300-2400 MHz	21.5 dBm
WCDMA BAND 1	Uplink: 1920-1980 MHz Downlink: 2110-2170 MHz	23.3 dBm
WCDMA BAND 8	Uplink: 880-915 MHz Downlink: 925-960 MHz	
E-GSM	Uplink: 880-915 MHz Downlink: 925-960 MHz	32.9 dBm
DCS	Uplink: 1710-1785 MHz Downlink: 1805-1880 MHz	29.9 dBm

1.c Frequency Band for Cellular Connection (for UC20-G version)

Band number	Operating Frequency	Max output power
WCDMA BAND 1	Uplink: 1922.4-1977.6 MHz Downlink: 2112.4-2167.6 MHz	22.47 dBm
WCDMA BAND 8	Uplink: 882.4-912.6 MHz Downlink: 927.4-957.6 MHz	22.48 dBm
E-GSM	Uplink: 880.2-914.8 MHz Downlink: 925.2-959.8 MHz	32.1 dBm
DCS	Uplink: 1710.2-1784.8 MHz Downlink: 1805.2-1879.8 MHz	28.9 dBm

1.d Frequency Band for WiFi Connection

Band	Operating Frequency	Max. Output Power (EIRP)
2.4G	2.4 – 2.4835 GHz	100 mW
5G	Not supported	NA

(2) DoC Information

You can get the DoC information of this product from the following URL:

<http://www.amitwireless.com/products-doc/>

(3) RF Exposure Statements

The antenna of the product, under normal use condition, is at least 20 cm away from the body of user.

(4) Unit Mounting Notice

The product is suitable for mounting at heights <= 2m (approx. 6 ft), or in a cabinet.

Ensure the unit is fixed tightly to reduce the likelihood of injury due to exposure to mechanical hazards if dropped.

4G IIoT RTU

(5) Manufacture Information

Manufacture Name: AMIT Wireless Inc.

Manufacture Address: No. 28, Lane 31, Sec. 1, Huandong Rd., Xinshi Dist., Tainan 74146, Taiwan (R.O.C.)

4G IIoT RTU

1.6 Hardware Installation

This chapter describes how to install and configure the hardware

1.6.1 Mount the Unit

The IOG500 series can be placed on a desktop, or mounted on the DIN Rail, and wall.

1.6.2 Insert the SIM Card, Micro-SD Card

WARNING: BEFORE INSERTING OR CHANGING THE SIM CARD AND/OR Micro-SD CARD, PLEASE MAKE SURE THAT POWER OF THE DEVICE IS SWITCHED OFF.

The SIM card slots are located at the right side of IOG500 series housing. You need to unscrew and remove the outer SIM card cover before installing or removing the SIM card. Please follow the instructions to insert or eject a SIM card. After SIM card is well placed, screw back the outer SIM card cover.

Step 1:

Loosen the screws as below and remove the SIM cover.

Step 2:

Push the SIM card into the slot A (SIM-A) or slot B (SIM-B).

Step 3:

Push the inserted SIM card again to eject it from the SIM slot.

4G IIoT RTU

1.6.3 Connecting Serial and I/O Devices

The IOG500 series product provides a 10-pin terminal block for one serial port 、one digital input (DI), and one digital output (DO). Connect the field device(s) to the I/O ports with the right pin assignments as shown below.

Pinout Definition

Pin1	Pin2	Pin3	Pin4	Pin5
GND	RS-232 TX RS-485 D-	DO-	DI-	P-GND
Pin6	Pin7	Pin8	Pin9	Pin10
GND	RS-232 RX RS-485 D+	DO+	DI+	PWR

Digital I/O Specification

Mode	Specification	
Digital Input	Trigger Voltage (high)	Logic level 1: 5V~30V
	Normal Voltage (low)	Logic level 0: 0V~2V
Digital Output	Non-Relay mode	24V/300mA

Example of Connection Diagram

4G IIoT RTU

1.6.4 Install the External Antenna

As illustrated in Section 1.3, there are several SMA antenna Jacks for you to install the required antennas for the RF signal transmission and receiving. You have to purchase required RF cables and antennas separately for a specific project or installation site to get excellent RF performance.

Since there is limited spacing for allocating all SMA antenna Jacks around the enclosure, the separation among SMA Jacks (or direct-attached antennas) could be not the optimized arrangement. It is very likely to get degraded RF performance at specific circumstances. It depends heavily on the environment.

However, there are well-known rules of thumb for solving the antenna separation issue.

- 1: The horizontal distance between antennas should be greater than 1/4 of its wavelength, and there will be best separation at 1/2 of its wavelength.**
- 2. If multiple frequency antennas are near each other, then use spacing distance of the lower frequency antenna, or even better try to satisfy the rule for both frequencies.**

Wavelength Table for Major RF Category

RF Category	Frequency	Wavelength	1/2 Wave Length (Best Separation)	1/4 Wave Length (Good Separation)
WiFi 802.11	5.8GHz	5.2cm	2.6cm	1.3cm
WiFi 802.11	2.4GHz	12.5cm	6.2cm	3.1cm
Cellular LTE	2600MHz	11.5cm	5.8cm	2.9cm
Cellular LTE	2100MHz	14.3cm	7.1cm	3.7cm
Cellular LTE	900MHz	33.3cm	16.6cm	8.3cm
Cellular LTE	700MHz	42.8cm	21.4cm	10.7cm
GPS	1.57GHz	19.0cm	9.5cm	4.7cm

For example, if you have a 900MHz LTE antenna and a WiFi 2.4GHz antenna, you would want them to be separated by at least 8.3cm to get good antenna separation.

So, it is recommended to use some external RF cables to extend and separate the adjacent antennas and get better antenna separation and RF performance, if required.

4G IIoT RTU

1.6.5 Connecting Power

The IOG500 series unit accepts 9~36V DC input power, and can be powered by DC12V or DC24V DC supply. It can be powered by connecting a power source to the power terminal block, as indicated below.

Please connect carefully your power source. Make sure the electrodes have been plugged into the right pins according to their assignments.

There is a DC12V/1A power adapter⁵ in the package for you to easily connect DC power adapter to this terminal block.

WARNING: This commercial-grade power adapter is mainly for ease of powering up the purchased device while initial configuration. It's not for operating at wide temperature range environment. PLEASE PREPARE OR PURCHASE OTHER INDUSTRIAL-GRADE POWER SUPPLY FOR POWERING UP THE DEVICE.

⁵ The maximum power consumption of IOG500 series product is 7.5W.

4G IIoT RTU

1.6.6 Connecting to the Network or a Host

The IOG500 series provides one RJ45 port to connect 10/100Mbps Ethernet. It can auto detect the transmission speed on the network and configure itself automatically. Connect one Ethernet cable to the RJ45 port (LAN) of the device and plug another end of the Ethernet cable into your computer's network port. In this way, you can use the RJ45 Ethernet cable to connect the device to the host PC's Ethernet port for configuring the device.

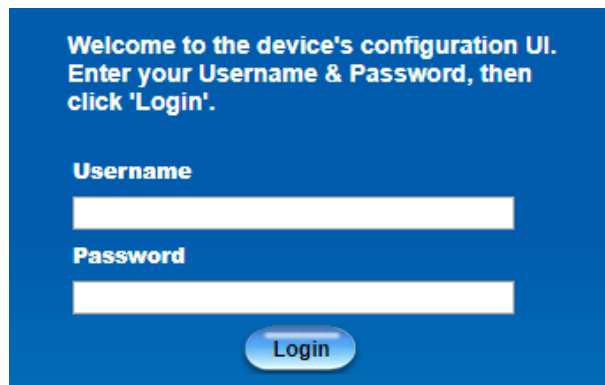

1.6.7 Setup by Configuring WEB UI

You can browse web UI to configure the device.

Type in the IP Address (<http://192.168.123.254>)⁶

When you see the login page, enter the user name and password and then click '**Login**' button. The default setting for both username and password is '**admin**'.

For the security consideration, you will be asked to change the login password while the first time login to the device.

⁶ The default LAN IP address of this gateway is 192.168.123.254. If you change it, you need to login by using the new IP address.

Change Password

For security consideration, you are being asked to change the password while the first time login to the device.

Enter the new password below.
(NOTE: The password must be at least 10 characters long, and must contain at least 1 English letter and 1 number. The password cannot be the same as the login account.)

New Password:

New Password Confirmation:
 

After that, you will be asked to login again with the new password.

Note 1: Keep the login password properly for further device configuration.

Note 2: If, someday, you lose or forget the login password, the ONLY way to remedy is to recover the device to its factory default settings via long-pressing the Reset button.

Note 3: Under such situation, your device configuration will be erased accordingly. So, In addition to keep the login password, you may have to backup the device donfiguration and keep it properly for any unexpected accident.

Chapter 2 Basic Network

2.1 WAN & Uplink

The diagram illustrates the navigation path for configuring WAN & Uplink. The flow starts at 'Basic Network', moves to 'WAN& Uplink', then to 'Physical Interface', 'Internet Setup', and finally 'End'. The screenshot shows the 'Physical Interface' configuration page with the following tables:

Interface Name	Physical Interface	Operation Mode	Action
WAN-1	3G/4G	Always on	<input type="button" value="Edit"/>

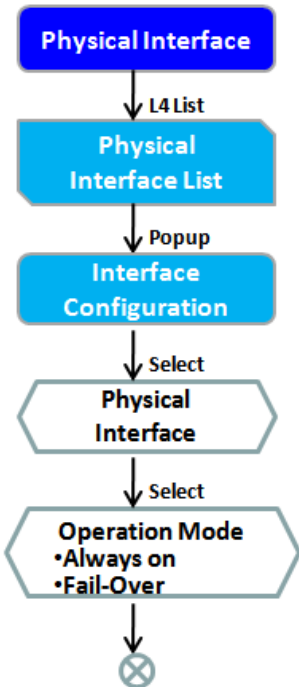

Item	Setting
Physical Interface	3G/4G
Operation Mode	Always on
VLAN Tagging	<input type="checkbox"/> Enable 0 (1-4095)

The gateway provides one WAN interface to let all client hosts in Intranet of the gateway access the Internet via ISP. But ISPs in the world apply various connection protocols to let gateways or user's devices dial in ISPs and then link to the Internet via different kinds of transmit media.

So, the WAN Connection lets you specify the WAN Physical Interface and Internet Setup for Intranet to access Internet. For each WAN interface, you must specify its physical interface first and then its Internet setup to connect to ISP.

4G IIoT RTU

2.1.1 Physical Interface

Physical Interface List			
Interface Name	Physical Interface	Operation Mode	Action
WAN-1	3G/4G	Always on	<button>Edit</button>

Interface Configuration (WAN - 1)	
Item	Setting
Physical Interface	3G/4G ▾
Operation Mode	Always on ▾
VLAN Tagging	<input type="checkbox"/> Enable 0 (1-4095)

The first step to configure one WAN interface is to specify which kind of connection media to be used for the WAN connection, as shown in "Physical Interface" page.

In "Physical Interface" page, there are two configuration windows, "Physical Interface List" and "Interface Configuration". "Physical Interface List" window shows all the available physical interfaces. After clicking on the "Edit" button for the interface in "Physical Interface List" window the "Interface Configuration" window will appear to let you configure a WAN interface.

Physical Interface:

- **3G/4G WAN:** The gateway has one built-in 3G/4G cellular as WAN connection. For each cellular WAN, there are 1 or 2 SIM cards to be inserted for special failover function.

Attention

- Please **MUST POWER OFF** the gateway before you insert or remove SIM card.
- The SIM card can be damaged if you insert or remove SIM card while the gateway is in operation.

4G IIoT RTU

Operation Mode:

There are three option items “Always on”, “Failover”, and “Disable” for the operation mode setting. However, for the single WAN device, only “Always on” is available.

Always on: Set this WAN interface to be active all the time. When two or more WAN are established at "Always on" mode, outgoing data will through these WAN connections base on load balance policies.

VLAN Tagging

Sometimes, your ISP required a VLAN tag to be inserted into the WAN packets from Gateway for specific services. Please enable VLAN tagging and specify tag in the WAN physical interface. Please be noted that only Ethernet and ADSL physical interfaces support the feature. VLAN tagging is not available for the gateway.

Physical Interface Setting

Go to **Basic Network > WAN > Physical Interface** tab.

The Physical Interface allows user to setup the physical WAN interface and to adjust WAN’s behavior.

Note: Numbers of available WAN Interfaces can be different for the purchased gateway.

Physical Interface List			
Interface Name	Physical Interface	Operation Mode	Action
WAN-1	3G/4G	Always on	<input type="button" value="Edit"/>

When **Edit** button is applied, an **Interface Configuration** screen will appear. WAN-1 interface is used in this example.

4G IIoT RTU

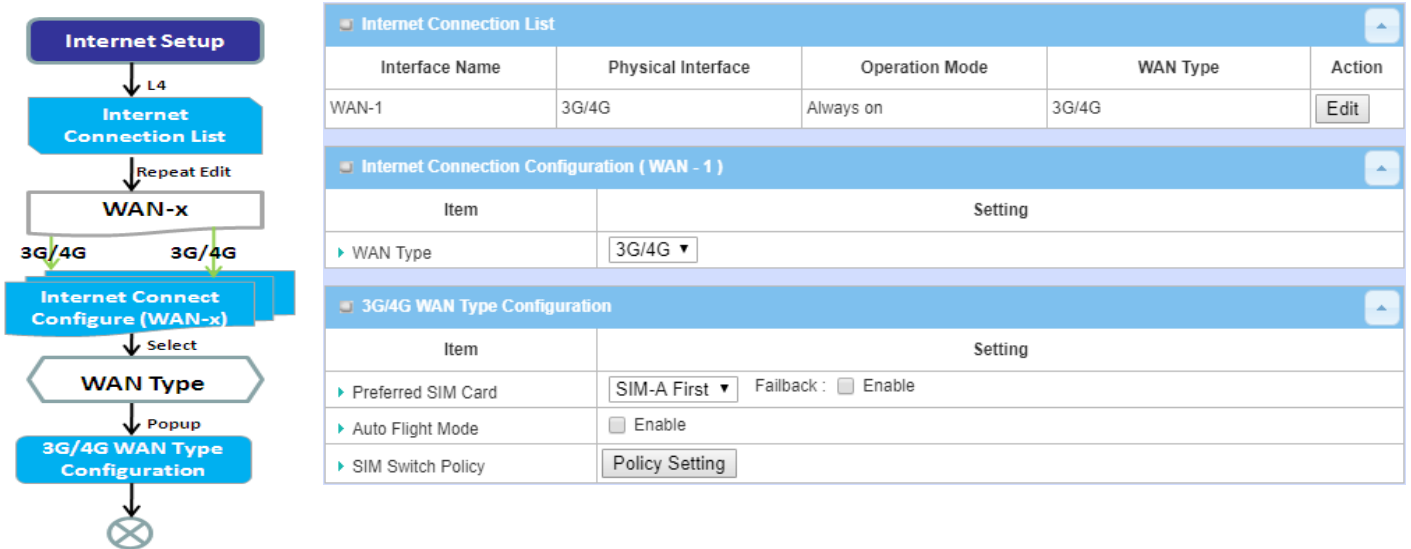

Interface Configuration:

Interface Configuration (WAN - 1)	
Item	Setting
▶ Physical Interface	3G/4G ▼
▶ Operation Mode	Always on ▼
▶ VLAN Tagging	<input type="checkbox"/> Enable 0 (1-4095)

Interface Configuration		
Item	Value setting	Description
Physical Interface	1. A Must fill setting 2. WAN-1 is the primary interface and is factory set to Always on.	Select one expected interface from the available interface dropdown list.
Operation Mode	A Must fill setting	Define the operation mode of the interface. Select Always on to make this WAN always active. (Note: for WAN-1, only Always on option is available.)
VLAN Tagging	Optional setting	Check Enable box to enter tag value provided by your ISP. Otherwise uncheck the box. <u>Value Range: 1 ~ 4095.</u> Note: This feature is NOT available for this gateway.

4G IIoT RTU

2.1.2 Connection Setup

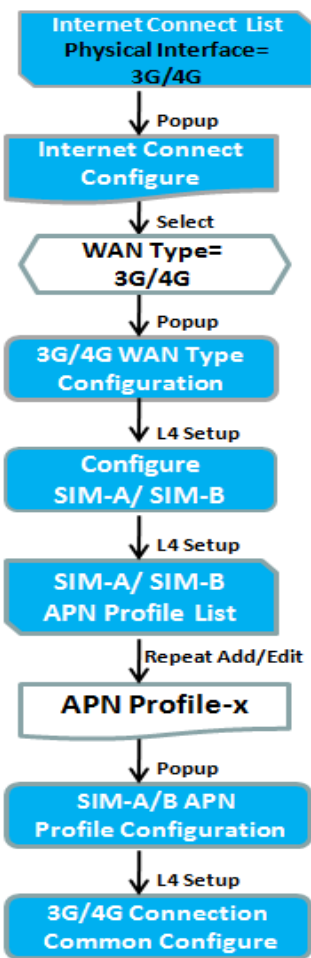

After specifying the physical interface for each WAN connection, administrator must configure their connection profile to meet the dial in process of ISP, so that all client hosts in the Intranet of the gateway can access the Internet.

In "Internet Setup" page, there are some configuration windows: "Internet Connection List", "Internet Connection Configuration", "WAN Type Configuration" and related configuration windows for each WAN type. For the Internet setup of each WAN interface, you must specify its WAN type of physical interface first and then its related parameter configuration for that WAN type.

After clicking on the "Edit" button of a physical interface in "Internet Setup List" window, the "Internet Connection Configuration" window will appear to let you specify which kind of WAN type that you will use for that physical interface to make an Internet connection. Based on your chosen WAN type, you can configure necessary parameters in each corresponding configuration window.

Preferred SIM Card – Dual SIM Fail Over

For 3G/4G embedded device, one embedded cellular module can create only one WAN interface. This device has featured by using dual SIM cards for one module with special fail-over mechanism. It is called Dual SIM Failover. This feature is useful for ISP switch over when location is changed. Within “Dual SIM Failover”, there are various usage scenarios, including "SIM-A First", "SIM-B First“ with “Failback” enabled or not, and “SIM-A Only and “SIM-B Only”.

4G IIoT RTU

SIM-A/SIM-B only: When “SIM-A Only” or “SIM-B Only” is used, the specified SIM slot card is the only one to be used for negotiation parameters between gateway device and cellular ISP.

SIM-A / SIM-B first without enable Failback

By default, “SIM-A First” scenario is used to connect to cellular ISP for data transfer. In the case of “SIM-A First” or “SIM-B First” scenario, the gateway will try to connect to the Internet by using SIM-A or SIM-B card first. And when the connection is broken, the gateway will switch to use the other SIM card for an alternate automatically and **will not switch back** to use original SIM card except current SIM connection is also broken. That is, SIM-A and SIM-B are used iteratively, but either one will keep being used for data transfer when current connection is still alive.

SIM-A / SIM-B first with Failback enable

With Failback option enabled, “SIM-A First” scenario is used to connect when the connection is broken, gateway system will switch to use SIM-B. And when SIM-A connection is recovered, it will switch back to use original SIM-A card

4G IIoT RTU

Connection Setup Setting

Go to **Basic Network > WAN > Connection Setup** tab.

Internet Setup allows user to setup WAN connection of the gateway. Numbers of available WAN Interfaces can be different for the purchased gateway.

Internet Connection List shows the basic information of each WAN. Click **Edit** button to configure. Then follow the following pages for detail settings.

Internet Connection List				
Interface Name	Physical Interface	Operation Mode	WAN Type	Action
WAN-1	3G/4G	Always on	3G/4G	<input type="button" value="Edit"/>

Internet Connection List		
Item	Value setting	Description
Interface Name	N/A	Shows the name of WAN interface.
Physical Interface	N/A	Physical Interface (i.e. 3G/4G) shows the type of interface configured to map with Interface Name .
Operation Mode	N/A	Operation Mode shows the current setting of Connection Control mode of WAN interface to keep WAN connection. <ul style="list-style-type: none">● Auto-reconnect (Always on)● Connect-on-demand● Connect Manually
WAN Type	N/A	WAN Type shows the type of connection method to your ISP. Depending on the device model, the following WAN connection types are supported. <ul style="list-style-type: none">● 3G/4G: 3G/4G

Note: If **Edit** button is disabled for the Interface, you will need to enable the Interface first by going to **Basic Network > WAN & Uplink > Physical Interface** page. Then Click **Edit** button then select Always on or Failover.

4G IIoT RTU

Internet Setup – 3G/4G WAN

Configure 3G/4G WAN Setting

When **Edit** button is applied, **Internet Connection Configuration**, and **3G/4G WAN Configuration** screens will appear.

Note_1: Configurations of SIM-B Card follows the same rule of Configurations of SIM-A Card, here we list SIM-A as the example.

Note_2: Both **Connection with SIM-A Card** and **Connection with SIM-B Card** will pop up only when the **SIM-A First** or **SIM-B First** is selected, otherwise it only pops out one of them.

4G IIoT RTU

Connection with SIM-A/-B Card		
Item	Value setting	Description
Network Type	<ol style="list-style-type: none"> 1. A Must filled setting 2. By default Auto is selected 	<p>Select Auto to register a network automatically, regardless of the network type.</p> <p>Select 2G Only to register the 2G network only.</p> <p>Select 2G Prefer to register the 2G network first if it is available.</p> <p>Select 3G only to register the 3G network only.</p> <p>Select 3G Prefer to register the 3G network first if it is available.</p> <p>Select LTE only to register the LTE network only.</p> <p>Note: Options may be different due to the specification of the module.</p>
Dial-Up Profile	<ol style="list-style-type: none"> 1. A Must filled setting 2. By default Manual-configuration is selected 	<p>Specify the type of dial-up profile for your 3G/4G network. It can be Manual-configuration, APN Profile List, or Auto-detection.</p> <p>Select Manual-configuration to set APN (Access Point Name), Dial Number, Account, and Password to what your carrier provides.</p> <p>Select APN Profile List to set more than one profile to dial up in turn, until the connection is established. It will pop up a new filed, please go to Basic Network > WAN & Uplink > Internet Setup > SIM-A APN Profile List for details.</p> <p>Select Auto-detection to automatically bring out all configurations needed while dialing-up, by comparing the IMSI of the SIM card to the record listed in the manufacturer's database.</p> <p>Note_1: You are highly recommended to select the Manual or APN Profile List to specify the network for your subscription. Your ISP always provides such network settings for the subscribers.</p> <p>Note_2: If you select Auto-detection, it is likely to connect to improper network, or failed to find a valid APN for your ISP.</p>
APN	<ol style="list-style-type: none"> 1. A Must filled setting 2. String format : any text 	<p>Enter the APN you want to use to establish the connection.</p> <p>This is a must-filled setting if you selected Manual-configuration as dial-up profile scheme.</p>
IP Type	<ol style="list-style-type: none"> 1. A Must filled setting 2. By default IPv4 is selected 	<p>Specify the IP type of the network service provided by your 3G/4G network. It can be IPv4, IPv6, or IPv4/6.</p>
PIN code	<ol style="list-style-type: none"> 1. An Optional setting 2. String format : interger 	<p>Enter the PIN (Personal Identification Number) code if it needs to unlock your SIM card.</p>
Dial Number, Account, Password	<ol style="list-style-type: none"> 1. An Optional setting 2. String format : any text 	<p>Enter the optional Dial Number, Account, and Password settings if your ISP provided such settings to you.</p> <p>Note: These settings are only displayed when Manual-configuration is selected.</p>
Authentication	<ol style="list-style-type: none"> 1. A Must filled setting 2. By default Auto is selected 	<p>Select PAP (Password Authentication Protocol) and use such protocol to be authenticated with the carrier's server.</p> <p>Select CHAP (Challenge Handshake Authentication Protocol) and use such protocol to be authenticated with the carrier's server.</p> <p>When Auto is selected, it means it will authenticate with the server either PAP or CHAP.</p>
IP Mode	<ol style="list-style-type: none"> 1. A Must filled setting 2. By default Dynamic IP is selected 	<p>When Dynamic IP is selected, it means it will get all IP configurations from the carrier's server and set to the device directly.</p> <p>If you have specific application provided by the carrier, and want to set IP</p>

4G IIoT RTU

		configurations on your own, you can switch to Static IP mode and fill in all parameters that required, such as IP address, subnet mask and gateway. Note: IP Subnet Mask is a must filled setting, and make sure you have the right configuration. Otherwise, the connection may get issues.
Primary DNS	1. An Optional setting 2. String format : IP address (IPv4 type)	Enter the IP address to change the primary DNS (Domain Name Server) setting. If it is not filled-in, the server address is given by the carrier while dialing-up.
Secondary DNS	1. An Optional setting 2. String format : IP address (IPv4 type)	Enter the IP address to change the secondary DNS (Domain Name Server) setting. If it is not filled-in, the server address is given by the carrier while dialing-up.
Roaming	The box is unchecked by default	Check the box to establish the connection even the registration status is roaming, not in home network. Note: It may cost additional charges if the connection is under roaming.

Create/Edit SIM-A / SIM-B APN Profile List

You can add a new APN profile for the connection, or modify the content of the APN profile you added. It is available only when you select **Dial-Up Profile** as **APN Profile List**.

SIM-A APN Profile List Add Delete									
ID	Profile Name	APN	IP Type	Account	Password	Authentication	Priority	Enable	Actions

List all the APN profile you created, easily for you to check and modify. It is available only when you select **Dial-Up Profile** as **APN Profile List**.

When **Add** button is applied, an **APN Profile Configuration** screen will appear.

SIM-A/-B APN Profile Configuration		
Item	Value setting	Description
Profile Name	1. By default Profile-x is listed 2. String format : any text	Enter the profile name you want to describe for this profile.
APN	String format : any text	Enter the APN you want to use to establish the connection.
IP Type	1. A Must filled setting 2. By default IPv4 is selected	Specify the IP type of the network service provided by your 3G/4G network. It can be IPv4 , IPv6 , or IPv4/6 .
Account	String format : any text	Enter the Account you want to use for the authentication. Value Range: 0 ~ 53 characters.
Password	String format : any text	Enter the Password you want to use for the authentication.
Authentication	1. A Must filled setting 2. By default Auto is selected	Select the Authentication method for the 3G/4G connection. It can be Auto , PAP , CHAP , or None .
Priority	1. A Must filled setting 2. String format : integer	Enter the value for the dialing-up order. The valid value is from 1 to 16. It will start to dial up with the profile that assigned with the smallest number. Value Range: 1 ~ 16.

4G IIoT RTU

Profile	The box is checked by default	Check the box to enable this profile. Uncheck the box to disable this profile in dialing-up action.
Save	N/A	Click the Save button to save the configuration.
Undo	N/A	Click the X button to restore what you just configured back to the previous setting.

Setup 3G/4G Connection Common Configuration

Here you can change common configurations for 3G/4G WAN.

3G/4G Connection Common Configuration	
Item	Setting
▶ Connection Control	Auto-reconnect ▼
▶ Time Schedule	(0) Always ▼
▶ MTU Setup	<input type="checkbox"/> Enable
▶ IP Passthrough (Cellular Bridge)	<input type="checkbox"/> Enable Fixed MAC : <input type="text"/>
▶ NAT	<input checked="" type="checkbox"/> Enable
▶ IGMP	Disable ▼
▶ WAN IP Alias	<input type="checkbox"/> Enable <input type="text" value="10.0.0.1"/>

3G/4G Connection Common Configuration		
Item	Value setting	Description
Connection Control	By default Auto-reconnect is selected	<p>When Auto-reconnect is selected, it means it will try to keep the Internet connection on all the time whenever the physical link is connected.</p> <p>When Connect-on-demand is selected, it means the Internet connection will be established only when detecting data traffic.</p> <p>When Connect Manually is selected, it means you need to click the Connect button to dial up the connection manually. Please go to Status > Basic Network > WAN & Uplink tab for details.</p> <p>Note: If the WAN interface serves as the primary one for another WAN interface in Failover role(and vice versa), the Connection Control parameter will not be available on both WANs as the system must set it to "Auto-reconnect"</p>
Maximum Idle Time	<ol style="list-style-type: none"> 1. An Optional setting 2. By default 600 seconds is filled-in 	<p>Specify the maximum Idle time setting to disconnect the internet connection when the connection idle timed out.</p> <p>Value Range: 300 ~ 86400.</p> <p>Note: This field is available only when Connect-on-demand or Connect Manually is selected as the connection control scheme.</p>
Time Schedule	<ol style="list-style-type: none"> 1. A Must filled setting 2. By default (0) Always is selected 	<p>When (0) Always is selected, it means this WAN is under operation all the time. Once you have set other schedule rules, there will be other options to select. Please go to Object Definition > Scheduling for details.</p>
MTU Setup	<ol style="list-style-type: none"> 1. An Optional setting 	Check the Enable box to enable the MTU (Maximum Transmission Unit)

4G IIoT RTU

	2. Uncheck by default	limit, and specify the MTU for the 3G/4G connection. MTU refers to Maximum Transmission Unit. It specifies the largest packet size permitted for Internet transmission. Value Range: 1200 ~ 1500.
IP Pass-through (Cellular Bridge)	1. The box is unchecked by default 2. String format for Fixed MAC : MAC address, e.g. 00:50:18:aa:bb:cc	When Enable box is checked, it means the device will directly assign the WAN IP to the first connected local LAN client. However, when an optional Fixed MAC is filled-in a non-zero value, it means only the client with this MAC address can get the WAN IP address. Note: When the IP Pass-through is on, NAT and WAN IP Alias will be unavailable until the function is disabled again.
NAT	Check by default	Uncheck the box to disable NAT (Network Address Translation) function.
IGMP	By default Disable is selected	Select Auto to enable IGMP function. Check the Enable box to enable IGMP Proxy .
WAN IP Alias	1. Unchecked by default 2. String format: IP address (IPv4 type)	Check the box to enable WAN IP Alias , and fill in the IP address you want to assign.

Network Monitoring Configuration	
Item	Setting
▶ Network Monitoring Configuration	<input checked="" type="checkbox"/> Enable
▶ Checking Method	DNS Query ▼
▶ Loading Check	<input checked="" type="checkbox"/> Enable
▶ Query Interval	5 (seconds)
▶ Latency Threshold	3000 (ms)
▶ Fail Threshold	5 (Times)
▶ Target1	DNS1 ▼
▶ Target2	None ▼

Network Monitoring Configuration		
Item	Value setting	Description
Network Monitoring Configuration	1. An optional setting 2. Box is checked by default	Check the Enable box to activate the network monitoring function.
Checking Method	1. An Optional setting 2. DNS Query is set by default	Choose either DNS Query or ICMP Checking to detect WAN link. With DNS Query , the system checks the connection by sending DNS Query packets to the destination specified in Target 1 and Target 2. With ICMP Checking , the system will check connection by sending ICMP request packets to the destination specified in Target 1 and Target 2.
Loading Check	1. An optional setting 2. Box is checked by default	Check the Enable box to activate the loading check function. Enable Loading Check allows the gateway to ignore unreturned DNS queries or ICMP requests when WAN bandwidth is fully occupied. This is to prevent false link-down status.

4G IIoT RTU

Query Interval	<ol style="list-style-type: none"> 1. An Optional setting 2. 5 seconds is selected by default. 	<p>Specify a time interval as the DNS Query Interval.</p> <p>Query Interval defines the transmitting interval between two DNS Query or ICMP checking packets.</p> <p>With DNS Query, the system checks the connection by sending DNS Query packets to the destination specified in Target 1 and Target 2.</p> <p>Value Range: 2 ~ 14400.</p>
Check Interval	<ol style="list-style-type: none"> 1. An Optional setting 2. 5 seconds is selected by default. 	<p>Specify a time interval as the ICMP Checking Interval.</p> <p>Query Interval defines the transmitting interval between two DNS Query or ICMP checking packets.</p> <p>With ICMP Checking, the system will check connection by sending ICMP request packets to the destination specified in Target 1 and Target 2.</p> <p>Value Range: 2 ~ 14400.</p>
Latency Threshold	<ol style="list-style-type: none"> 1. An Optional setting 2. 3000 ms is set by default 	<p>Enter a number of detecting disconnection times to be the threshold before disconnection is acknowledged.</p> <p>Latency Threshold defines the tolerance threshold of responding time.</p> <p>Value Range: 2000 ~ 3000 seconds.</p>
Fail Threshold	<ol style="list-style-type: none"> 1. An Optional setting 2. 5 times is set by default 	<p>Enter a number of detecting disconnection times to be the threshold before disconnection is acknowledged.</p> <p>Fail Threshold specifies the detected disconnection before the router recognize the WAN link down status.</p> <p>Value Range: 1 ~ 10 times.</p>
Target 1	<ol style="list-style-type: none"> 1. An Optional filled setting 2. DNS1 is selected by default 	<p>Target1 specifies the first target of sending DNS query/ICMP request.</p> <p>DNS1: set the primary DNS to be the target.</p> <p>DNS2: set the secondary DNS to be the target.</p> <p>Gateway: set the Current gateway to be the target.</p> <p>Other Host: enter an IP address to be the target.</p>
Target 2	<ol style="list-style-type: none"> 1. An Optional filled setting 2. None is selected by default 	<p>Target1 specifies the second target of sending DNS query/ICMP request.</p> <p>None: no second target is required.</p> <p>DNS1: set the primary DNS to be the target.</p> <p>DNS2: set the secondary DNS to be the target.</p> <p>Gateway: set the Current gateway to be the target.</p> <p>Other Host: enter an IP address to be the target.</p>
Save	N/A	Click Save to save the settings.
Undo	N/A	Click Undo to cancel the settings.

4G IIoT RTU

2.2 LAN & VLAN

This section provides the configuration of LAN and VLAN. VLAN is an optional feature, and it depends on the product specification of the purchased gateway.

2.2.1 Ethernet LAN

The Local Area Network (LAN) can be used to share data or files among computers attached to a network. Following diagram illustrates the network that wired and interconnects computers.

Please follow the following instructions to do IPv4 Ethernet LAN Setup.

Configuration	
Item	Setting
▶ IP Mode	Static IP
▶ LAN IP Address	<input type="text" value="192.168.123.254"/>
▶ Subnet Mask	<input type="text" value="255.255.255.0 (/24)"/> ▼

Configuration Item	Value setting	Description
IP Mode	N/A	It shows the LAN IP mode for the gateway according to the related configuration. Static IP: If there is at least one WAN interface activated, the LAN IP mode is fixed in Static IP mode. Dynamic IP: If all the available WAN interfaces are disabled, the LAN IP mode can be Dynamic IP mode.
LAN IP Address	1. A Must filled setting 2. 192.168.123.254 is set by default	Enter the local IP address of this device. The network device(s) on your network must use the LAN IP address of this device as their Default Gateway. You can change it if necessary. Note: It's also the IP address of web UI. If you change it, you need to type new IP address in the browser to see web UI.
Subnet Mask	1. A Must filled setting 2. 255.255.255.0 (/24) is set	Select the subnet mask for this gateway from the dropdown list. Subnet mask defines how many clients are allowed in one network or subnet.

4G IIoT RTU

	by default	The default subnet mask is 255.255.255.0 (/24), and it means maximum 254 IP addresses are allowed in this subnet. However, one of them is occupied by LAN IP address of this gateway, so there are maximum 253 clients allowed in LAN network. Value Range: 255.0.0.0 (/8) ~ 255.255.255.252 (/30).
Save	N/A	Click the Save button to save the configuration
Undo	N/A	Click the Undo button to restore what you just configured back to the previous setting.

Create / Edit Additional IP

This gateway provides the LAN IP alias function for some special management consideration. You can add additional LAN IP for this gateway, and access to this gateway with the additional IP.

Additional IP
Add

4G IIoT RTU

2.2.2 VLAN (not supported)

Not supported feature for the purchased product, leave it as blank.

4G IIoT RTU

2.2.3 DHCP Server

➤ DHCP Server

The gateway supports up to 4 DHCP servers to fulfill the DHCP requests from different VLAN groups (please refer to VLAN section for getting more usage details). And there is one default setting for whose LAN IP Address is the same one of gateway LAN interface, with its default Subnet Mask setting as “255.255.255.0”, and its default IP Pool ranges is from “.100” to “.200” as shown at the DHCP Server List page on gateway’s WEB UI.

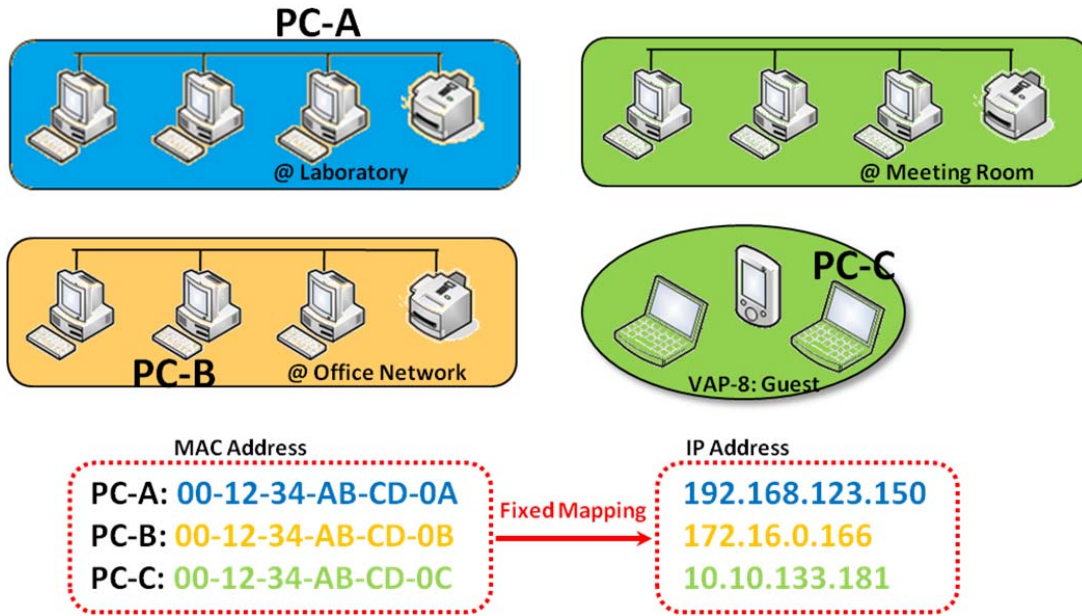

User can add more DHCP server configurations by clicking on the “Add” button behind “DHCP Server List”, or clicking on the “Edit” button at the end of each DHCP Server on list to edit its current settings. Besides, user can select a DHCP Server and delete it by clicking on the “Select” check-box and the “Delete” button.

4G IIoT RTU

➤ Fixed Mapping

User can assign fixed IP address to map the specific client MAC address by select them then copy, when targets were already existed in the **DHCP Client List**, or to add some other Mapping Rules by manually in advance, once the target's MAC address was not ready to connect.

4G IIoT RTU

DHCP Server Setting

Go to **Basic Network > LAN & VLAN > DHCP Server** Tab.

The DHCP Server setting allows user to create and customize DHCP Server policies to assign IP Addresses to the devices on the local area network (LAN).

Create / Edit DHCP Server Policy

The gateway allows you to custom your DHCP Server Policy. If multiple LAN ports are available, you can define one policy for each LAN (or VLAN group), and it supports up to a maximum of 4 policy sets.

The gateway provides WiFi interface for mobile devices or BYOD devices to connect for Internet/Intranet accessing. WiFi function is usually modularized design in a gateway, and there can be single or dual modules within a gateway. The WiFi system in the gateway complies with IEEE 802.11ac/11n/11g/11b standard in 2.4GHz or 5GHz single band or 2.4G/5GHz concurrent dual bands of operation. There are several wireless operation modes provided by this device. They are: “**AP Router Mode**”, “**WDS Only Mode**”, and “**WDS Hybrid Mode**”. You can choose the expected mode from the wireless operation mode list.

There are some sub-sections for you to configure the WiFi function, including “Basic Configuration” and “Advanced Configuration”. In Basic Configuration section, you have to finish almost all the settings for using the WiFi function. And the Advanced Configuration section provides more parameters for advanced user to fine tune the connectivity performance for the WiFi function.

Due to optional module(s) and frequency band, you need to setup module one by one. For each module, you need to specify the operation mode, and then setup the virtual APs for wireless access.

Hereunder are the scenarios for each wireless operation mode, you can get how it works, and what is the difference among them. To connect your wireless devices with the wireless gateway, make sure your application scenario for WiFi network and choose the most adequate operation mode.

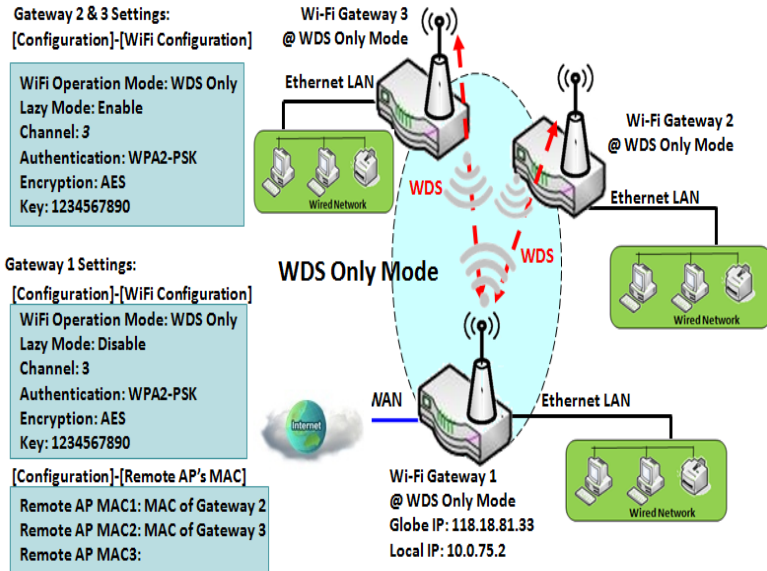

AP Router Mode

This mode allows you to get your wired and wireless devices connected to form the Intranet of the wireless gateway, and the Intranet will link to the Internet with NAT mechanism of the gateway. So, this gateway is working as a WiFi AP, but also a WiFi hotspot for Internet accessing service. It means local WiFi clients can associate to it, and go to Internet. With its NAT mechanism, all of wireless clients don't need to get public IP addresses from ISP.

4G IIoT RTU

WDS Only Mode

WDS (Wireless Distributed System) Only mode drives a WiFi gateway to be a bridge for its wired Intranet and a repeater to extend distance. You can use multiple WiFi gateways as a WiFi repeater chain with all gateways setup as "WDS Only" mode. All gateways can communicate with each other through WiFi. All wired client hosts within each gateway can also communicate each other in the scenario. Only one gateway within repeater chain can be DHCP server to provide IP for all wired client hosts of every gateway which being disabled DHCP server. This gateway can be NAT router to provide internet access. The diagram illustrates that there are two wireless gateways 2, 3 running at "WDS Only" mode. They both use channel 3 to link to local Gateway 1 through WDS. Both gateways connected by WDS need to setup the remote AP MAC for each other. All client hosts under gateway 2, 3 can request IP address from the DHCP server at gateway 1. Besides, wireless Gateway 1 also execute the NAT mechanism for all client hosts Internet accessing.

WDS Hybrid Mode

WDS hybrid mode includes both WDS and AP Router mode. WDS Hybrid mode can act as an access point for its WiFi Intranet and a WiFi bridge for its wired and WiFi Intranets at the same time. Users can thus use the features to build up a large wireless network in a large space like airports, hotels or campus.

The diagram illustrates Gateway 1, Gateway 2 and AP 1 connected by WDS. Each gateway has access point function for WiFi client access. Gateway 1 has DHCP server to assign IP to each client hosts. All gateways and AP are under WDS hybrid mode. To setup WDS hybrid mode, it need to fill all configuration items similar to that of AP-router and WDS modes.

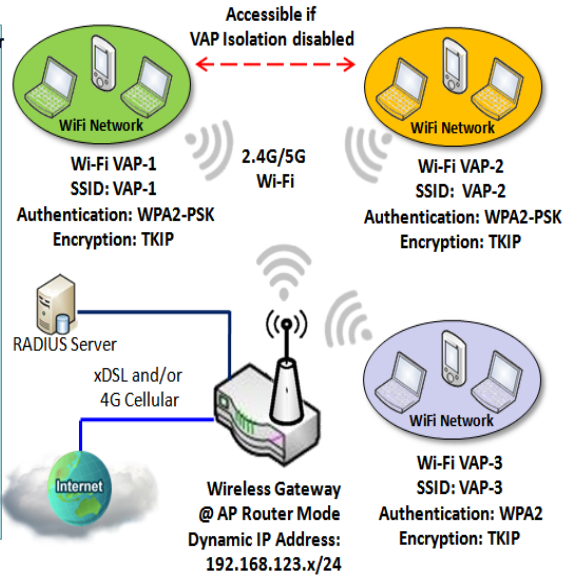

Multiple VAPs

Gateway Settings:

WiFi Operation Mode: AP Router
VAP1
 SSID: VAP-1
 Authentication: WPA2-PSK
 Encryption: TKIP
 Key: 1234567890

VAP2
 SSID: VAP-2
 Authentication: WPA2-PSK
 Encryption: TKIP
 Key: 1234567890

VAP3
 SSID: VAP-3
 Authentication: WPA2
 Encryption: TKIP
 RADIUS Server IP: 192.168.168.
 RADIUS Server Port: 1812
 RADIUS Shared Key

VAP (Virtual Access Point) is function to partition wireless network into multiple broadcast domains. It can simulate multiple APs in one physical AP. This wireless gateway supports up to 8 VAPs. For each VAP, you need to setup SSID, authentication and encryption to control Wi-Fi client access.

Besides, there is a VAP isolation option to manage the access among VAPs. You can allow or blocks communication for the wireless clients connected to different VAPs. As shown in the diagram, the clients in VAP-1 and VAP-2 can communicate to each other when VAP Isolation is disabled.

Wi-Fi Security – Authentication & Encryption

Wi-Fi security provides complete authentication and encryption mechanisms to enhance the data security while your data is transferred wirelessly over the air. The wireless gateway supports Shared, WPA-PSK / WPA2-PSK and WPA / WPA2 authentication. You can select one authentication scheme to validate the wireless clients while they are connecting to the AP. As to the data encryption, the gateway supports WEP, TKIP and AES. The selected encryption algorithm will be applied to the data while the wireless connection is established.

4G IIoT RTU

WiFi Configuration Setting

The WiFi configuration allows user to configure 2.4GHz or 5GHz WiFi settings.

Go to **Basic Network > WiFi > WiFi Module One** Tab. If the gateway is equipped with two WiFi modules, there will be another **WiFi Module Two**. You can do the similar configurations on both WiFi modules.

Basic Configuration

Basic Configuration	
Item	Setting
▶ Operation Band	2.4G Single Band ▼

Item	Value setting	Description
Operation Band	A Must filled setting	Specify the intended operation band for the WiFi module. Basically, this setting is fixed and cannot be changed once the module is integrated into the product. However, there is some module with selectable band for user to choose according to his network environment. Under such situation, you can specify which operation band is suitable for the application.

Configure WiFi Setting

2.4G WiFi Configuration

For the detail description about VAP configuration, please refer to the description stated in AP-Router section.

4G IIoT RTU

WDS Hybrid Mode

For the WDS Hybrid mode, the device bridges all the wired **LAN** and **WLAN** clients to another WDS or WDS hybrid enabled WiFi devices which the device associated with.

WiFi Operation Mode	WDS Hybrid Mode ▾
Lazy Mode	<input type="checkbox"/> Enable
Green AP	<input type="checkbox"/> Enable
VAP Isolation	<input checked="" type="checkbox"/> Enable
Time Schedule	(0) Always ▾
Scan Remote AP's MAC List	Scan
Remote AP MAC 1	<input type="text"/>
Remote AP MAC 2	<input type="text"/>
Remote AP MAC 3	<input type="text"/>
Remote AP MAC 4	<input type="text"/>

WDS Hybrid Mode		
Item	Value setting	Description
Lazy Mode	The box is checked by default.	Check the Enable box to activate this function. With the function been enabled, the device can auto-learn WDS peers without manually entering other AP's MAC address. But at least one of the APs has to fill remote AP MAC addresses.
Green AP	The box is unchecked by default.	Check the Enable box to activate Green AP function.
VAP Isolation	The box is checked by default.	Check the Enable box to activate this function. By default, the box is checked; it means that stations which associated to different VAPs cannot communicate with each other.
Time Schedule	A Must filled setting	Apply a specific Time Schedule to this rule; otherwise leave it as (0) Always . If the dropdown list is empty ensure Time Schedule is pre-configured. Refer to Object Definition > Scheduling > Configuration tab.
Scan Remote AP's MAC List	Available when Lazy Mode disabled.	Press the Scan button to scan the spatial AP information, and then select one from the AP list, the MAC of selected AP will be auto filled in the following Remote AP MAC table.
Remote AP MAC 1~4	Available when Lazy Mode disabled.	Enter the remote AP's MAC manually, or via auto-scan approach, The device will bridge the traffic to the remote AP when associated successfully.

2.4G VAP List								
ID	VAP	SSID	Authentication	Encryption	STA Isolation	Broadcast SSID	Enable	Actions
1	VAP 1	Staff_2.4G	WPA2-PSK	AES	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="button" value="Edit"/> <input type="checkbox"/> Select

By default, VAP 1 is enabled and security key is required to connect to the gateway wirelessly to enhance the security level and prevent unexpected access of un-authorized devices.

The default wifi key is printed on both the device label and the Security Card. It is created randomly and

4G IIoT RTU

differs from devices. So, you can connected to the VAP1 (SSID: Staff_2.4G) with the provided key. However, it is strongly recommended that you have to change the security key to a easy-to-remember one by clicking the Edit button.

Under **WDS Hybrid** mode, the VAP function is available and you can further specifying the required VAP settings for connecting with wireless client devices.

Click **Add / Edit** button in the VAP List screen to create or edit the settings for a VAP. A VAP Configuration screen will appear.

For VAP 1:

2.4G VAP Configuration

2.3.2 Wireless Client List

The **Wireless Client List** page shows the information of wireless clients which are associated with this device.

Go to **Basic Network > WiFi > Wireless Client List** Tab.

Select Target WiFi

Target WiFi	
Item	Setting
▶ Module Select	One ▾
▶ Operation Band	2.4G ▾
▶ Multiple AP Names	All ▾

Item	Value setting	Description
Module Select	A Must filled setting.	Select the WiFi module to check the information of connected clients. For those single WiFi module products, this option is hidden.
Operation Band	A Must filled setting.	Specify the intended operation band for the WiFi module. Basically, this setting is fixed and cannot be changed once the module is integrated into the product. However, there is some module with selectable band for user to choose according to his network environment. Under such situation, you can specify which operation band is suitable for the application.
Multiple AP Names	1. A Must filled setting. 2. All is selected by default.	Specify the VAP to show the associated clients information in the following Client List. By default, All VAP is selected.

Show Client List

The following Client List shows the information for wireless clients that is associated with the selected VAP(s).

Client List								
IP Address Configuration & Address	Host Name	MAC Address	Mode	Rate	RSSI0	RSSI1	Signal	Interface

Item	Value setting	Description
IP Address Configuration & Address	N/A	It shows the Client's IP address and the deriving method. Dynamic means the IP address is derived from a DHCP server. Static means the IP address is a fixed one that is self-filled by client.
Host Name	N/A	It shows the host name of client.
MAC Address	N/A	It shows the MAC address of client.
Mode	N/A	It shows what kind of Wi-Fi system the client used to associate with this device.
Rate	N/A	It shows the data rate between client and this device.

4G IIoT RTU

RSSI0, RSSI1	N/A	It shows the RX sensitivity (RSSI) value for each radio path.
Signal	N/A	The signal strength between client and this device.
Interface	N/A	It shows the VAP ID that the client associated with.
Refresh	N/A	Click the Refresh button to update the Client List immediately.

4G IIoT RTU

2.3.3 Advanced Configuration

This device provides advanced wireless configuration for professional user to optimize the wireless performance under the specific installation environment. Please note that if you are not familiar with the WiFi technology, just leave the advanced configuration with its default values, or the connectivity and performance may get worse with improper settings.

Go to **Basic Network > WiFi > Advanced Configuration Tab**.

Select Target WiFi

Target WiFi

4G IIoT RTU

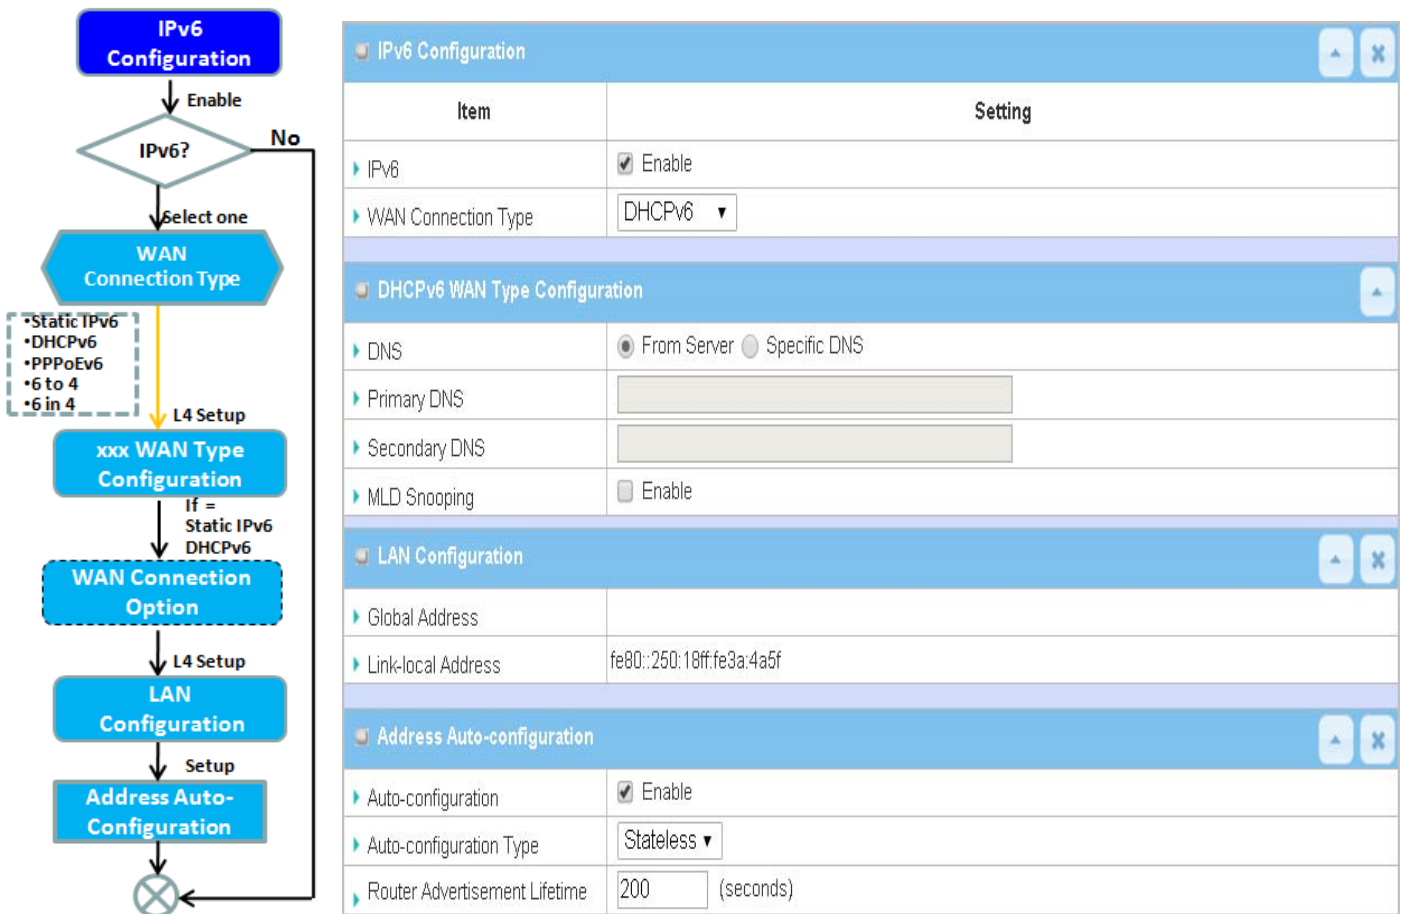

▶ Dynamic Frequency Selection	<input checked="" type="checkbox"/> Enable
-------------------------------	--

Advanced Configuration		
Item	Value setting	Description
Regulatory Domain	The default setting is according to where the product sale to	It limits the available radio channel of this device. The permissible channels depend on the Regulatory Domain .
Beacon Interval	100	It shows the time interval between each beacon packet broadcasted. The beacon packet contains SSID , Channel ID and Security setting .
DTIM Interval	3	A DTIM (Delivery Traffic Indication Message) is a countdown informing clients of the next window for listening to broadcast message. When the device has buffered broadcast message for associated client, it sends the next DTIM with a DTIM value.
RTS Threshold	2347	RTS (Request to send) Threshold means when the packet size is over the setting value, then active RTS technique. RTS/CTS is a collision avoidance technique. It means RTS never activated when the threshold is set to 2347 .
Fragmentation	2346	Wireless frames can be divided into smaller units (fragments) to improve performance in the presence of RF interference at the limits of RF coverage.
WMM	The box is checked by default	WMM (WiFi Multimedia) can help control latency and jitter when transmitting multimedia content over a wireless connection.
Short GI	By default 400ns is selected	Short GI (Guard Interval) is defined to set the sending interval between each packet. Note that lower Short GI could increase not only the transition rate but also error rate .
TX Rate	By default Best is selected	It means the data transition rate . When Best is selected, the device will choose a proper data rate according to signal strength .
RF Bandwidth	By default Auto is selected	The setting of RF bandwidth limits the maximum data rate.
Transmit Power	By default 100% is selected	Normally the wireless transmitter operates at 100% power. By setting the transmit power to control the WiFi coverage .
5G Band Steering	The box is unchecked by default	When the client station associate with 2.4G WiFi, the device will send the client to 5G WiFi automatically if the client is available on accessing this 5G Wi-Fi band. This option is only available on the module that supports 5GHz band.
WIDS	The box is unchecked by default	The WIDS (Wireless Intrusion Detection System) will analyze all packets and make a statistic table in WiFi status. Go to Status > Basic Network > WiFi tab for detailed WIDS status.
Dynamic Frequency Selection	The box is checked by default	Dynamic Frequency Selection (DFS) is a legally required feature for all WiFi devices that share the 5 GHz band with radar. DFS enables a gateway to detect radar signals and switch their operating frequency to prevent interference. This process ensures that radar systems send and receive accurate information. Note: Dynamic Frequency Selection (DFS) option is only available for the WiFi module with 5GHz radio.
Save	N/A	Click the Save button to save the current configuration.
Undo	N/A	Click the Undo button to restore configuration to previous setting before saving.

2.4 IPv6

The growth of the Internet has created a need for more addresses than are possible with IPv4. IPv6 (Internet Protocol version 6) is a version of the Internet Protocol (IP) intended to succeed IPv4, which is the protocol currently used to direct almost all Internet traffic. IPv6 also implements additional features not present in IPv4. It simplifies aspects of address assignment (stateless address auto-configuration), network renumbering and router announcements when changing Internet connectivity providers.

2.4.1 IPv6 Configuration

The **IPv6 Configuration** setting allows user to set the IPv6 connection type to access the IPv6 network. This gateway supports various types of IPv6 connection, including **Static IPv6**, **DHCPv6**, and **PPPoEv6**

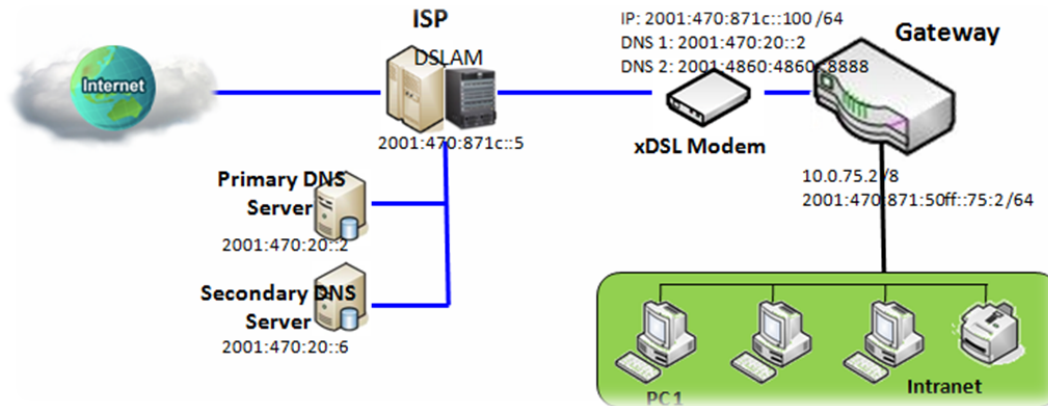

Note: The available WAN connection types can be different, depending on the Interface type of WAN-1.

4G IIoT RTU

IPv6 WAN Connection Type

Static IPv6

Static IPv6 does the same function as static IPv4. The static IPv6 provides manual setting of IPv6 address, IPv6 default gateway address, and IPv6 DNS.

Above diagram depicts the IPv6 IP addressing, type in the information provided by your ISP to setup the IPv6 network.

DHCPv6

DHCP in IPv6 does the same function as DHCP in IPv4. The DHCP server sends IP address, DNS server addresses and other possible data to the DHCP client to configure automatically. The server also sends a lease time of the address and time to re-contact the server for IPv6 address renewal. The client has then to resend a request to renew the IPv6 address.

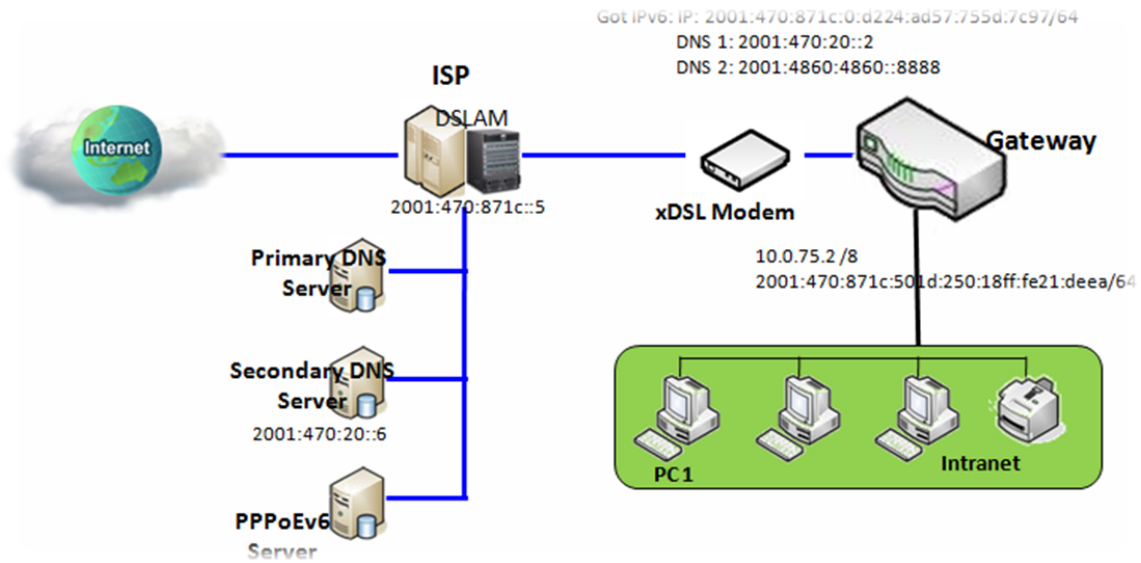

Above diagram depicts DHCP IPv6 IP addressing, the DHCPv6 server on the ISP side assigns IPv6 address, IPv6 default gateway address, and IPv6 DNS to client host's automatically.

4G IIoT RTU

PPPoEv6

PPPoEv6 in IPv6 does the same function as PPPoE in IPv4. The PPPoEv6 server provides configuration parameters based on PPPoEv6 client request. When PPPoEv6 server gets client request and successfully authenticates it, the server sends IP address, DNS server addresses and other required parameters to automatically configure the client.

The diagram above depicts the IPv6 addressing through PPPoE, PPPoEv6 server (DSLAM) on the ISP side provides IPv6 configuration upon receiving PPPoEv6 client request. When PPPoEv6 server gets client request and successfully authenticates it, the server sends IP address, DNS server addresses and other required parameters to automatically configure the client.

4G IIoT RTU

IPv6 Configuration Setting

Go to **Basic Network > IPv6 > Configuration** Tab.

The **IPv6 Configuration** setting allows user to set the IPv6 connection type to access the IPv6 network.

IPv6 Configuration	
Item	Setting
▶ IPv6	<input checked="" type="checkbox"/> Enable
▶ WAN Connection Type	DHCPv6 ▾

Item	Value setting	Description
IPv6	The box is unchecked by default,	Check the Enable box to activate the IPv6 function.
WAN Connection Type	1. A Must filled setting 2. DHCPv6 is selected by default	Define the selected IPv6 WAN Connection Type to establish the IPv6 connectivity via WAN-1 Interface. Select Static IPv6 when your ISP provides you with a set IPv6 addresses. Select DHCPv6 when your ISP provides you with DHCPv6 services. Select PPPoEv6 when your ISP provides you with PPPoEv6 account settings. Note: The available WAN connection types can be different, depending on the Interface type of WAN-1.

Address Auto-configuration		
Item	Value setting	Description
Auto-configuration	The box is unchecked by default	Check to enable the Auto configuration feature.
Auto-configuration Type	1. Only can be selected when Auto-configuration enabled 2. Stateless is selected by default	Define the selected IPv6 WAN Connection Type to establish the IPv6 connectivity. Select Stateless to manage the Local Area Network to be SLAAC + RDNSS Router Advertisement Lifetime (A Must filled setting): Enter the Router Advertisement Lifetime (in seconds). 200 is set by default. <u>Value Range:</u> 0 ~ 65535. Select Stateful to manage the Local Area Network to be Stateful (DHCPv6) . IPv6 Address Range (Start) (A Must filled setting): Enter the start IPv6 Address for the DHCPv6 range for your local computers. 0100 is set by default. <u>Value Range:</u> 0001 ~ FFFF. IPv6 Address Range (End) (A Must filled setting): Enter the end IPv6 Address for the DHCPv6 range for your local computers. 0200 is set by default. <u>Value Range:</u> 0001 ~ FFFF. IPv6 Address Lifetime (A Must filled setting): Enter the DHCPv6 lifetime for your local computers. 36000 is set by default. <u>Value Range:</u> 0 ~ 65535.

2.5 Port Forwarding

Network address translation (NAT) is a methodology of remapping one IP address space into another by modifying network address information in Internet Protocol (IP) datagram packet headers while they are in transit across a traffic routing device. The technique was originally used for ease of rerouting traffic in IP networks without renumbering every host. It has become a popular and essential tool in conserving global address space allocations in face of IPv4 address exhaustion. The product you purchased embeds and activates the NAT function. You also can disable the NAT function in **[Basic Network]-[WAN & Uplink]-[Internet Setup]-[WAN Type Configuration]** page.

Usually all local hosts or servers behind corporate gateway are protected by NAT firewall. NAT firewall will filter out unrecognized packets to protect your Intranet. So, all local hosts are invisible to the outside world. Port forwarding or port mapping is function that redirects a communication request from one address and port number combination to assigned one. This technique is most commonly used to make services on a host residing on a protected or masqueraded (internal) network available to hosts on the opposite side of the gateway (external network), by remapping the destination IP address and port number

4G IIoT RTU

2.5.1 Configuration

NAT Loopback

This feature allows you to access the WAN global IP address from your inside NAT local network. It is useful when you run a server inside your network. For example, if you set a mail server at LAN side, your local devices can access this mail server through gateway's global IP address when enable NAT loopback feature. On either side are you in accessing the email server, at the LAN side or at the WAN side, you don't need to change the IP address of the mail server.

Configuration Setting

Go to **Basic Network > Port Forwarding > Configuration** tab.

The NAT Loopback allows user to access the WAN IP address from inside your local network.

Enable NAT Loopback

NAT Loopback	
Item	Setting
NAT Loopback	<input checked="" type="checkbox"/> Enable

Configuration Item	Value setting	Description
NAT Loopback	The box is checked by default	Check the Enable box to activate this NAT function
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the settings

4G IIoT RTU

2.5.2 Virtual Server & Virtual Computer

The screenshot shows a configuration interface with three main sections:

- Configuration:** A table with two rows. The first row is 'Virtual Server' with an 'Enable' checkbox that is unchecked. The second row is 'Virtual Computer' with an 'Enable' checkbox that is checked.
- Virtual Server List:** A table with columns: ID, WAN Interface, Server IP, Source IP, Protocol, Public Port, Private Port, Time Schedule, Enable, and Actions. It includes 'Add' and 'Delete' buttons.
- Virtual Computer List:** A table with columns: ID, Global IP, Local IP, Enable, and Actions. It includes 'Add' and 'Delete' buttons.

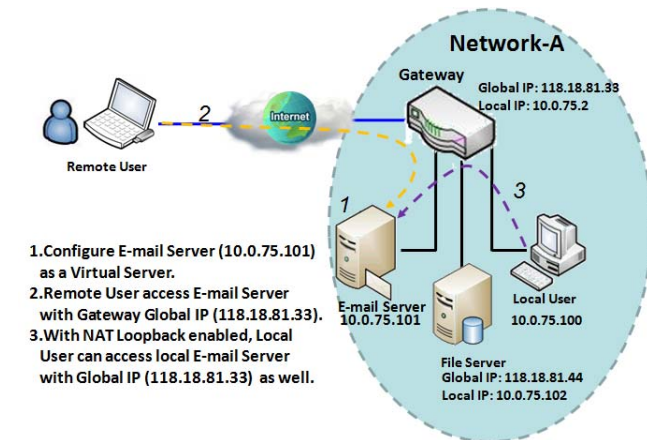

There are some important Port Forwarding functions implemented within the gateway, including "Virtual Server", "NAT loopback" and "Virtual Computer".

It is necessary for cooperate staffs who travel outside and want to access various servers behind office gateway. You can set up those servers by using "Virtual Server" feature. After trip, if want to access those servers from LAN side by global IP, without change original setting, NAT Loopback can achieve it.

"Virtual computer" is a host behind NAT gateway whose IP address is a global one and is visible to the outside world. Since it is behind NAT, it is protected by gateway firewall. To configure Virtual Computer, you just have to map the local IP of the virtual computer to a global IP.

4G IIoT RTU

Virtual Server & NAT Loopback

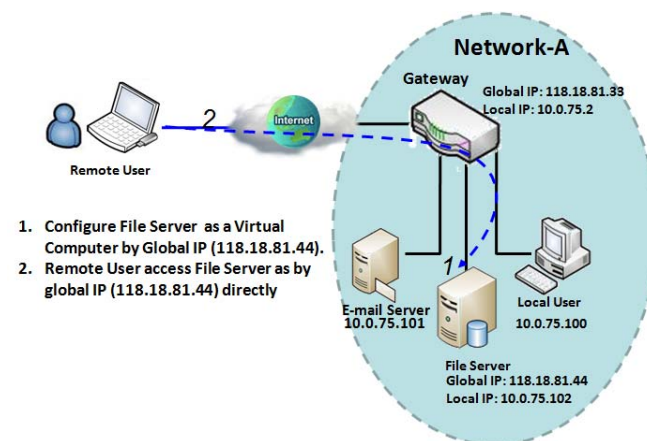

"Virtual Server" allows you to access servers with the global IP address or FQDN of the gateway as if they are servers existed in the Internet. But in fact, these servers are located in the Intranet and are physically behind the gateway. The gateway serves the service requests by port forwarding the requests to the LAN servers and transfers the replies from LAN servers to the requester on the WAN side. As shown in example, an E-mail virtual server is defined to be located at a server with IP address 10.0.75.101 in the Intranet of Network-A, including SMTP service port 25 and POP3 service port 110. So, the remote user can access the E-mail server with the

gateway's global IP 118.18.81.33 from its WAN side. But the real E-mail server is located at LAN side and the gateway is the port forwarder for E-mail service.

NAT Loopback allows you to access the WAN global IP address from your inside NAT local network. It is useful when you run a server inside your network. For example, if you set a mail server at LAN side, your local devices can access this mail server through gateway's global IP address when enable NAT loopback feature. On either side are you in accessing the email server, at the LAN side or at the WAN side, you don't need to change the IP address of the mail server.

Virtual Computer

"Virtual Computer" allows you to assign LAN hosts to global IP addresses, so that they can be visible to outside world. While so, they are also protected by the gateway firewall as being client hosts in the Intranet. For example, if you set a FTP file server at LAN side with local IP address 10.0.75.102 and global IP address 118.18.82.44, a remote user can access the file server while it is hidden behind the NAT gateway. That is because the gateway takes care of all accessing to the IP address 118.18.82.44, including to forward the access requests to the file server and to send the replies from the server to outside world.

4G IIoT RTU

Virtual Server & Virtual Computer Setting

Go to **Basic Network > Port Forwarding > Virtual Server & Virtual Computer** tab.

Enable Virtual Server and Virtual Computer

Configuration	
Item	Setting
▶ Virtual Server	<input type="checkbox"/> Enable
▶ Virtual Computer	<input checked="" type="checkbox"/> Enable

Configuration Item	Value setting	Description
Virtual Server	The box is unchecked by default	Check the Enable box to activate this port forwarding function
Virtual Computer	The box is checked by default	Check the Enable box to activate this port forwarding function
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the settings.

Create / Edit Virtual Server

The gateway allows you to custom your Virtual Server rules. It supports up to a maximum of 20 rule-based Virtual Server sets.

Virtual Server List

Create / Edit Virtual Computer

The gateway allows you to custom your Virtual Computer rules. It supports up to a maximum of 20 rule-based Virtual Computer sets.

Virtual Computer List Add Delete				
ID	Global IP	Local IP	Enable	Actions

When **Add** button is applied, **Virtual Computer Rule Configuration** screen will appear.

Virtual Computer Rule Configuration		
Global IP	Local IP	Enable
<input type="text"/>	<input type="text"/>	<input type="checkbox"/>

Virtual Computer Rule Configuration		
Item	Value setting	Description
Global IP	A Must filled setting	This field is to specify the IP address of the WAN IP.
Local IP	A Must filled setting	This field is to specify the IP address of the LAN IP.
Enable	N/A	Then check Enable box to enable this rule.
Save	N/A	Click the Save button to save the settings.

4G IIoT RTU

2.5.3 DMZ & Pass Through

DMZ (De Militarized Zone) Host is a host that is exposed to the Internet cyberspace but still within the protection of firewall by gateway device. So, the function allows a computer to execute 2-way communication for Internet games, Video conferencing, Internet telephony and other special applications. In some cases when a specific application is blocked by NAT mechanism, you can indicate that LAN computer as a DMZ host to solve this problem.

The DMZ function allows you to ask the gateway pass through all normal packets to the DMZ host behind the NAT gateway only when these packets are not expected to receive by applications in the gateway or by other client hosts in the Intranet. Certainly, the DMZ host is also protected by the gateway firewall. Activate the feature and specify the DMZ host with a host in the Intranet when needed.

Configuration	
Item	Setting
DMZ	<input checked="" type="checkbox"/> Enable <input checked="" type="checkbox"/> All <input type="checkbox"/> WAN-1 <input type="checkbox"/> WAN-2 <input type="checkbox"/> WAN-3 <input type="checkbox"/> WAN-4 DMZ Host: <input type="text" value="10.0.75.100"/>
Pass Through Enable	<input checked="" type="checkbox"/> IPSec <input checked="" type="checkbox"/> PPTP <input checked="" type="checkbox"/> L2TP

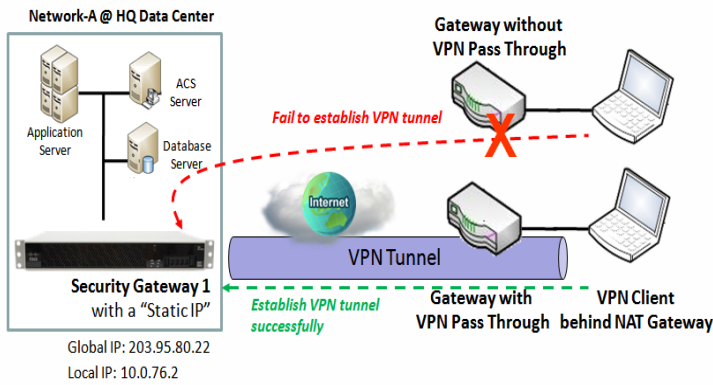

DMZ Scenario

When the network administrator wants to set up some service daemons in a host behind NAT gateway to allow remote users request for services from server actively, you just have to configure this host as DMZ Host. As shown in the diagram, there is an X server installed as DMZ host, whose IP address is 10.0.75.100. Then, remote user can request services from X server just as it is provided by the gateway whose global IP address is 118.18.81.33. The gateway will forward those packets, not belonging to any configured virtual server or applications, directly to the DMZ host.

4G IIoT RTU

VPN Pass through Scenario

Since VPN traffic is different from that of TCP or UDP connection, it will be blocked by NAT gateway. To support the pass through function for the VPN connections initiating from VPN clients behind NAT gateway, the gateway must implement some kind of VPN pass through function for such application. The gateway support the pass through function for IPSec, PPTP, and L2TP connections, you just have to check the corresponding checkbox to activate it.

DMZ & Pass Through Setting

Go to **Basic Network > Port Forwarding > DMZ & Pass Through** tab.

The DMZ host is a host that is exposed to the Internet cyberspace but still within the protection of firewall by gateway device.

Enable DMZ and Pass Through

Configuration	
Item	Setting
DMZ	<input type="checkbox"/> Enable <input checked="" type="checkbox"/> All <input type="checkbox"/> WAN-1 <input type="checkbox"/> WAN-2 <input type="checkbox"/> WAN-3 <input type="checkbox"/> WAN-4 DMZ Host : <input type="text"/>
Pass Through Enable	<input checked="" type="checkbox"/> IPSec <input checked="" type="checkbox"/> PPTP <input checked="" type="checkbox"/> L2TP

Configuration Item	Value setting	Description
DMZ	1. A Must filled setting 2. Default is ALL .	Check the Enable box to activate the DMZ function Define the selected interface to be the packet-entering interface of the gateway, and fill in the IP address of Host LAN IP in DMZ Host field . If the packets to be filtered are coming from WAN-x then select WAN-x for this field. Select ALL for packets coming into the router from any interfaces. It can be selected WAN-x box when WAN-x enabled.

4G IIoT RTU

		Note: The available check boxes (WAN-1 ~ WAN-4) depend on the number of WAN interfaces for the product.
Pass Through Enable	The boxes are checked by default	Check the box to enable the pass through function for the IPSec , PPTP , and L2TP . With the pass through function enabled, the VPN hosts behind the gateway still can connect to remote VPN servers.
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the settings

2.6 Routing

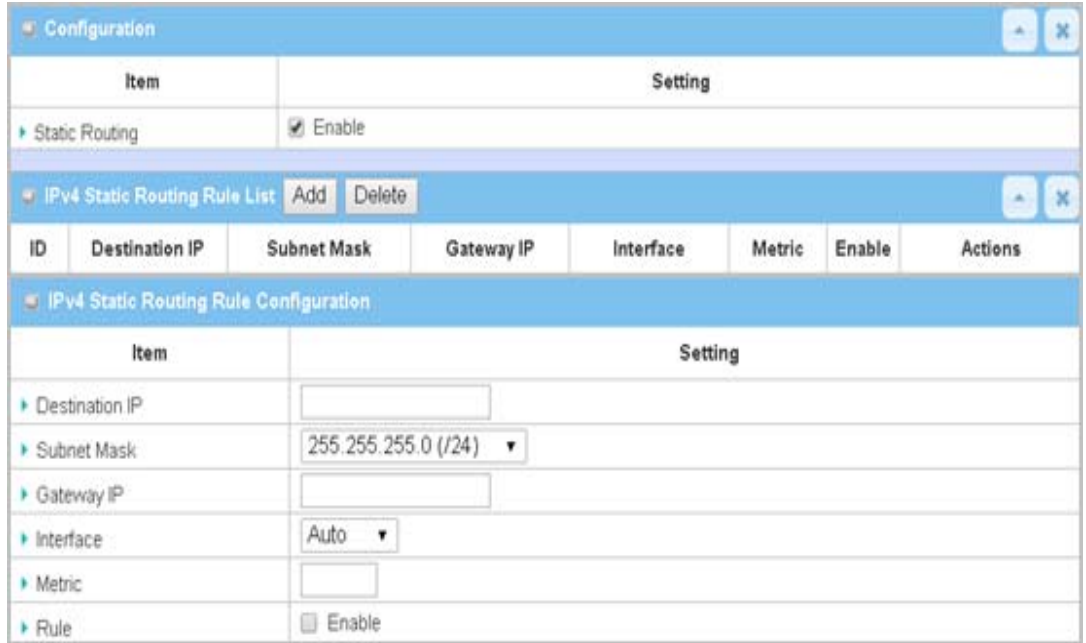

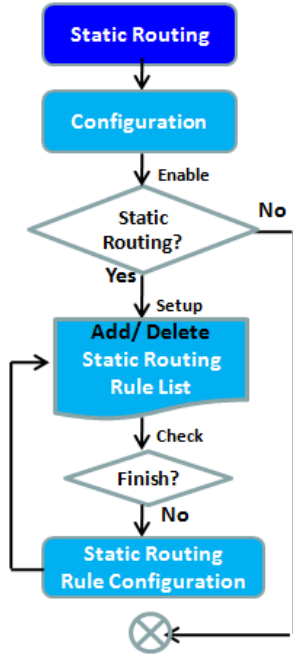

If you have more than one router and subnet, you will need to enable routing function to allow packets to find proper routing path and allow different subnets to communicate with each other. Routing is the process of selecting best paths in a network. It is performed for many kinds of networks, like electronic data networks (such as the Internet), by using packet switching technology. The routing process usually directs forwarding on the basis of routing tables which maintain a record of the routes to various network destinations. Thus, constructing routing tables, which are held in the router's memory, is very important for efficient routing. Most routing algorithms use only one network path at a time.

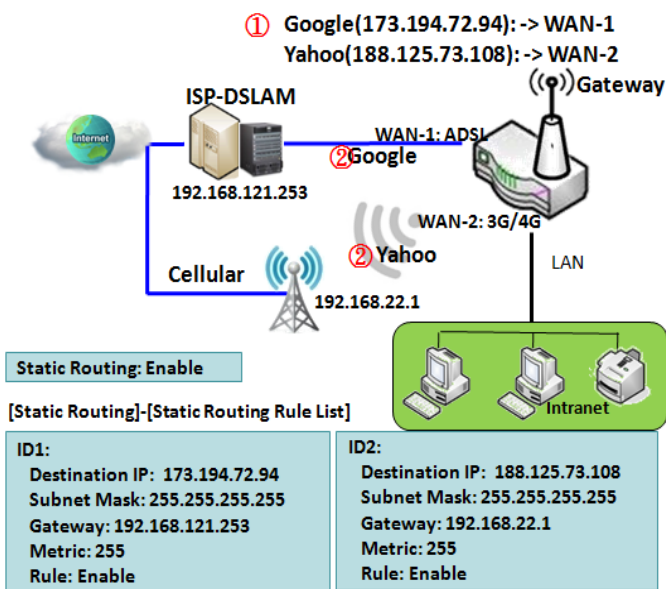

The routing tables record your pre-defined routing paths for some specific destination subnets. It is **static routing**. However, if the contents of routing tables record the obtained routing paths from neighbor routers by using some protocols, such as RIP, OSPF and BGP. It is **dynamic routing**. These both routing approaches will be illustrated one after one. In addition, the gateway also built in one advanced configurable routing software Quagga for more complex routing applications, you can configure it if required via Telnet CLI.

4G IIoT RTU

2.6.1 Static Routing

"Static Routing" function lets you define the routing paths for some dedicated hosts/servers or subnets to store in the routing table of the gateway. The gateway routes incoming packets to different peer gateways based on the routing table. You need to define the static routing information in gateway routing rule list.

When the administrator of the gateway wants to specify what kinds of packets to be transferred via which gateway interface and which peer gateway to their destination. It can be carried out by the "Static Routing" feature. Dedicated packet flows from the Intranet will be routed to their destination via the pre-defined peer gateway and corresponding gateway interface that are defined in the system routing table by manual.

As shown in the diagram, when the destination is Google access, rule 1 set interface as ADSL, routing gateway as IP-DSLAM gateway 192.168.121.253. All the packets to Google will go through WAN-1. And the same way applied to rule 2 of access Yahoo. Rule 2 sets 3G/4G as interface.

4G IIoT RTU

Static Routing Setting

Go to **Basic Network > Routing > Static Routing** Tab.

There are three configuration windows for static routing feature, including "Configuration", "Static Routing Rule List" and "Static Routing Rule Configuration" windows. "Configuration" window lets you activate the global static routing feature. Even there are already routing rules, if you want to disable routing temporarily, just uncheck the Enable box to disable it. "Static Routing Rule List" window lists all your defined static routing rule entries. Using "Add" or "Edit" button to add and create one new static routing rule or to modify an existed one.

When "Add" or "Edit" button is applied, the "Static Routing Rule Configuration" window will appear to let you define a static routing rule.

Enable Static Routing

Just check the **Enable** box to activate the "Static Routing" feature.

Item	Setting
Static Routing	<input checked="" type="checkbox"/> Enable

Static Routing Item	Value setting	Description
Static Routing	The box is unchecked by default	Check the Enable box to activate this function

Create / Edit Static Routing Rules

The Static Routing Rule List shows the setup parameters of all static routing rule entries. To configure a static routing rule, you must specify related parameters including the destination IP address and subnet mask of dedicated host/server or subnet, the IP address of peer gateway, the metric and the rule activation.

ID	Destination IP	Subnet Mask	Gateway IP	Interface	Metric	Enable	Actions
----	----------------	-------------	------------	-----------	--------	--------	---------

The gateway allows you to custom your static routing rules. It supports up to a maximum of 64 rule sets. When **Add** button is applied, **Static Routing Rule Configuration** screen will appear, while the **Edit** button at the end

4G IIoT RTU

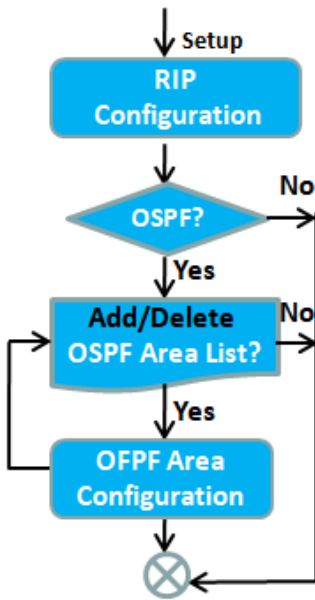

of each static routing rule can let you modify the rule.

IPv4 Static Routing Rule Configuration	
Item	Setting
▶ Destination IP	<input type="text"/>
▶ Subnet Mask	255.255.255.0 (/24) ▼
▶ Gateway IP	<input type="text"/>
▶ Interface	Auto ▼
▶ Metric	<input type="text"/>
▶ Rule	<input type="checkbox"/> Enable

IPv4 Static Routing		
Item	Value setting	Description
Destination IP	1. IPv4 Format 2. A Must filled setting	Specify the Destination IP of this static routing rule.
Subnet Mask	255.255.255.0 (/24) is set by default	Specify the Subnet Mask of this static routing rule.
Gateway IP	1. IPv4 Format 2. A Must filled setting	Specify the Gateway IP of this static routing rule.
Interface	Auto is set by default	Select the Interface of this static routing rule. It can be Auto , or the available WAN / LAN interfaces.
Metric	1. Numeric String Format 2. A Must filled setting	The Metric of this static routing rule. <i>Value Range: 0 ~ 255.</i>
Rule	The box is unchecked by default.	Click Enable box to activate this rule.
Save	NA	Click the Save button to save the configuration
Undo	NA	Click the Undo button to restore what you just configured back to the previous setting.
Back	NA	When the Back button is clicked the screen will return to the Static Routing Configuration page.

4G IIoT RTU

2.6.2 Dynamic Routing

RIP Configuration	
Item	Setting
RIP Enable	Disable

OSPF Configuration	
Item	Setting

Router ID	
Authentication	None
Backbone Subnet	

OSPF Area List				
ID	Area Subnet	Area ID	Enable	Actions

BGP Configuration	
Item	Setting
BGP	<input type="checkbox"/> Enable
ASN	
Router ID	

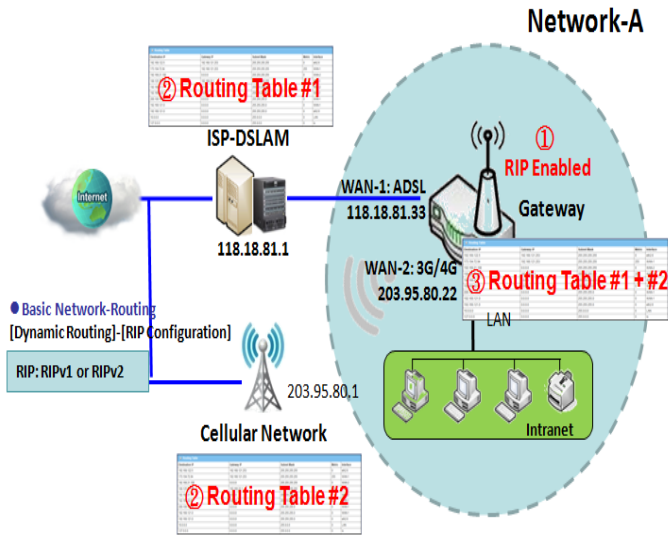

Dynamic Routing, also called adaptive routing, describes the capability of a system, through which routes are characterized by their destination, to alter the path that the route takes through the system in response to a change in network conditions.

This gateway supports dynamic routing protocols, including RIPv1/RIPv2 (Routing Information Protocol), and OSPF (Open Shortest Path First), for you to establish routing table automatically. The feature of dynamic routing will be very useful when there are lots of subnets in your network. Generally speaking, RIP is suitable for small network. OSPF is more suitable for medium network.

The supported dynamic routing protocols are described as follows.

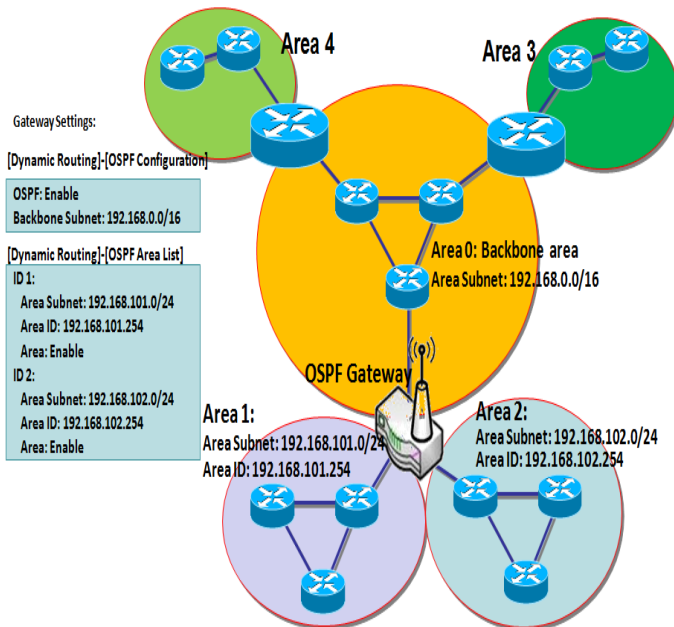

4G IIoT RTU

RIP Scenario

The Routing Information Protocol (RIP) is one of the oldest distance-vector routing protocols, which employs the hop count as a routing metric. RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops allowed for RIP is 15. This hop limit, however, also limits the size of networks that RIP can support. A hop count of 16 is considered an infinite distance, in other words the route is considered unreachable. RIP implements the split horizon, route poisoning and hold-down mechanisms to prevent incorrect routing information from being propagated.

OSPF Scenario

Open Shortest Path First (OSPF) is a routing protocol that uses link state routing algorithm. It is the most widely used interior gateway protocol (IGP) in large enterprise networks. It gathers link state information from available routers and constructs a topology map of the network. The topology is presented as a routing table which routes datagrams based solely on the destination IP address.

Network administrator can deploy OSPF gateway in large enterprise network to get its routing table from the enterprise backbone, and forward routing information to other routers, which are not linked to the enterprise backbone. Usually, an OSPF network is subdivided into routing areas to simplify administration and optimize traffic and resource utilization.

As shown in the diagram, OSPF gateway gathers routing information from the backbone gateways in area 0, and will forward its routing information to the routers in area 1 and area 2 which are not in the backbone.

4G IIoT RTU

Dynamic Routing Setting

Go to **Basic Network > Routing > Dynamic Routing** Tab.

The dynamic routing setting allows user to customize RIP, and OSPF protocols through the router based on their office setting.

In the "Dynamic Routing" page, there are several configuration windows for dynamic routing feature. They are the "RIP Configuration" window, "OSPF Configuration" window, "OSPF Area List", and "OSPF Area Configuration" window. RIP, and OSPF protocols can be configured individually.

The "RIP Configuration" window lets you choose which version of RIP protocol to be activated or disable it. The "OSPF Configuration" window can let you activate the OSPF dynamic routing protocol and specify its backbone subnet. Moreover, the "OSPF Area List" window lists all defined areas in the OSPF network.

RIP Configuration

The RIP configuration setting allows user to customize RIP protocol through the router based on their office setting.

Item	Setting
RIP Enable	Disable

Item	Value setting	Description
RIP Enable	Disable is set by default	Select Disable will disable RIP protocol. Select RIP v1 will enable RIPv1 protocol. Select RIP v2 will enable RIPv2 protocol.

OSPF Configuration

The OSPF configuration setting allows user to customize OSPF protocol through the router based on their office setting.

4G IIoT RTU

OSPF Configuration	
Item	Setting
▶ OSPF	<input type="checkbox"/> Enable
▶ Router ID	<input type="text"/>
▶ Authentication	None ▾
▶ Backbone Subnet	<input type="text"/>

OSPF Configuration		
Item	Value setting	Description
OSPF	Disable is set by default	Click Enable box to activate the OSPF protocol.
Router ID	1. IPv4 Format 2. A Must filled setting	The Router ID of this router on OSPF protocol
Authentication	None is set by default	The Authentication method of this router on OSPF protocol. Select None will disable Authentication on OSPF protocol. Select Text will enable Text Authentication with entered the Key in this field on OSPF protocol. Select MD5 will enable MD5 Authentication with entered the ID and Key in these fields on OSPF protocol.
Backbone Subnet	1. Classless Inter Domain Routing (CIDR) Subnet Mask Notation. (Ex: 192.168.1.0/24) 2. A Must filled setting	The Backbone Subnet of this router on OSPF protocol.

Create / Edit OSPF Area Rules

The gateway allows you to custom your OSPF Area List rules. It supports up to a maximum of 32 rule sets.

OSPF Area List Add Delete				
ID	Area Subnet	Area ID	Enable	Actions

When **Add** button is applied, **OSPF Area Rule Configuration** screen will appear.

4G IIoT RTU

OSPF Area Configuration
⏪ ⏩

Item	Setting
▶ Area Subnet	<input style="width: 100%;" type="text"/>
▶ Area ID	<input style="width: 100%;" type="text"/>
▶ Area	<input type="checkbox"/> Enable

OSPF Area Configuration		
Item	Value setting	Description
Area Subnet	1. Classless Inter Domain Routing (CIDR) Subnet Mask Notation. (Ex: 192.168.1.0/24) 2. A Must filled setting	The Area Subnet of this router on OSPF Area List.
Area ID	1. IPv4 Format 2. A Must filled setting	The Area ID of this router on OSPF Area List.
Area	The box is unchecked by default.	Click Enable box to activate this rule.
Save	N/A	Click the Save button to save the configuration

4G IIoT RTU

2.6.3 Routing Information

The routing information allows user to view the routing table and policy routing information. Policy Routing Information is only available when the Load Balance function is enabled and the Load Balance Strategy is By User Policy.

Go to **Basic Network > Routing > Routing Information** Tab.

Routing Table				
Destination IP	Subnet Mask	Gateway IP	Metric	Interface
100.105.167.72	255.255.255.252	0.0.0.0	0	WAN-2
192.168.66.0	255.255.255.0	0.0.0.0	0	LAN
192.168.127.0	255.255.255.0	0.0.0.0	0	WAN-1
169.254.0.0	255.255.0.0	0.0.0.0	0	LAN
127.0.0.0	255.0.0.0	0.0.0.0	0	lo

Routing Table		
Item	Value setting	Description
Destination IP	N/A	Routing record of Destination IP. IPv4 Format.
Subnet Mask	N/A	Routing record of Subnet Mask. IPv4 Format.
Gateway IP	N/A	Routing record of Gateway IP. IPv4 Format.
Metric	N/A	Routing record of Metric. Numeric String Format.
Interface	N/A	Routing record of Interface Type. String Format.

Policy Routing Information				
Policy Routing Source	Source IP	Destination IP	Destination Port	WAN Interface
Load Balance	-	-	-	-

Policy Routing Information		
Item	Value setting	Description
Policy Routing Source	N/A	Policy Routing of Source. String Format.
Source IP	N/A	Policy Routing of Source IP. IPv4 Format.
Destination IP	N/A	Policy Routing of Destination IP. IPv4 Format.
Destination Port	N/A	Policy Routing of Destination Port. String Format.
WAN Interface	N/A	Policy Routing of WAN Interface. String Format.

2.7 DNS & DDNS

How does user access your server if your WAN IP address changes all the time? One way is to register a new domain name, and maintain your own DNS server. Another simpler way is to apply a domain name to a third-party DDNS service provider. The service can be free or charged. If you want to understand the basic concepts of DNS and Dynamic DNS, you can refer to Wikipedia website^{7,8}.

2.7.1 DNS & DDNS Configuration

Dynamic DNS

To host your server on a changing IP address, you have to use dynamic domain name service (DDNS). Therefore, anyone wishing to reach your host only needs to know the domain name. Dynamic DNS will map the name of your host to your current IP address, which changes each time you connect your Internet service provider.

The Dynamic DNS service allows the gateway to alias a public dynamic IP address to a static domain name, allowing the gateway to be more easily accessed from various locations on the Internet. As shown in the diagram, user registered a domain

name to a third-party DDNS service provider (NO-IP) to use DDNS function. Once the IP address of designated WAN interface has changed, the dynamic DNS agent in the gateway will inform the DDNS server with the new IP address. The server automatically re-maps your domain name with the changed IP address. So, other hosts or remote users in the Internet world are able to link to your gateway by using your domain name regardless of the changing global IP address.

7 http://en.wikipedia.org/wiki/Domain_Name_System

8 http://en.wikipedia.org/wiki/Dynamic_DNS

4G IIoT RTU

DNS & DDNS Setting

Go to **Basic Network > DNS & DDNS > Configuration** Tab.

The DNS & DDNS setting allows user to setup Dynamic DNS feature and DNS redirect rules.

Setup Dynamic DNS

The gateway allows you to custom your Dynamic DNS settings.

Item	Setting
▶ DDNS	<input type="checkbox"/> Enable
▶ WAN Interface	WAN-1
▶ Provider	DynDNS.org(Dynamic)
▶ Host Name	
▶ User Name / E-Mail	
▶ Password / Key	

DDNS (Dynamic DNS) Configuration		
Item	Value setting	Description
DDNS	The box is unchecked by default	Check the Enable box to activate this function.
WAN Interface	WAN 1 is set by default	Select the WAN Interface IP Address of the gateway.
Provider	DynDNS.org (Dynamic) is set by default	Select your DDNS provider of Dynamic DNS. It can be DynDNS.org(Dynamic) , DynDNS.org(Custom) , NO-IP.com , etc...
Host Name	1. String format can be any text 2. A Must filled setting	Your registered host name of Dynamic DNS. Value Range: 0 ~ 63 characters.
User Name / E-Mail	1. String format can be any text 2. A Must filled setting	Enter your User name or E-mail addresss of Dynamic DNS.
Password / Key	1. String format can be any text 2. A Must filled setting	Enter your Password or Key of Dynamic DNS.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

4G IIoT RTU

Setup DNS Redirect

DNS redirect is a special function to redirect certain traffics to a specified host. Administator can manage the internet / intranet traffics that are going to access some restricted DNS and force those traffics to be redirected to a specified host.

DNS Redirect	
Item	Setting
▶ DNS Redirect	<input type="checkbox"/> Enable

DNS Redirect Configuration		
Item	Value setting	Description
DNS Redirect	The box is unchecked by default	Check the Enable box to activate this function.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

If you enabled the DNS Redirect function, you have to further specify the redirect rules. According to the rules, the gateway can redirect the traffic that matched the DNS to corresponding pre-defined IP address.

Redirect Rule					
ID	Mapping Rule	Condition	Description	Enable	Action

When **Add** button is applied, **Redirect Rule** screen will appear.

Redirect Rule					
Item	Setting				
Mapping Rule	<table border="1"> <thead> <tr> <th>Domain Name</th> <th>IP</th> </tr> </thead> <tbody> <tr> <td><input type="text"/> (* for Any)</td> <td><input type="text"/></td> </tr> </tbody> </table>	Domain Name	IP	<input type="text"/> (* for Any)	<input type="text"/>
Domain Name	IP				
<input type="text"/> (* for Any)	<input type="text"/>				
Condition	Always				
Description	<input type="text"/>				
Enable	<input type="checkbox"/> Enable				

Redirect Rule Configuration		
Item	Value setting	Description
Domain Name	1. String format can be any text	Enter a domain name to be redirect. The traffic to specified domain name will be redirect to the following IP address.

4G IIoT RTU

	2. A Must filled setting	<i>Value Range:</i> at least 1 character is required; '*' for any.
IP	1. IPv4 format 2. A Must filled setting	Enter an IP Address as the target for the DNS redirect.
Condition	1. A Must filled setting 2. Always is selected by default.	Specify when will the DNS redirect action can be applied. It can be Always , or WAN Block . Always: The DNS redirect function can be applied to matched DNS all the time. WAN Block: The DNS redirect function can be applied to matched DNS only when the WAN connection is disconnected, or un-reachable.
Description	1. String format can be any text 2. A Must filled setting	Enter a brief description for this rule. <i>Value Range:</i> 0 ~ 63 characters.
Enable	The box is unchecked by default	Click the Enable button to activate this rule.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

Chapter 3 Object Definition

3.1 Scheduling

Scheduling provides ability of adding/deleting time schedule rules, which can be applied to other functionality.

3.1.1 Scheduling Configuration

Go to **Object Definition > Scheduling > Configuration** tab.

Time Schedule List		
Add Delete		
ID	Rule Name	Actions

Button description		
Item	Value setting	Description
Add	N/A	Click the Add button to configure time schedule rule
Delete	N/A	Click the Delete button to delete selected rule(s)

When **Add** button is applied, Time Schedule Configuration and Time Period Definition screens will appear.

Time Schedule Configuration	
Item	Setting
▶ Rule Name	<input type="text"/>
▶ Rule Policy	Inactivate the Selected Days and Hours Below.

Time Schedule Configuration		
Item	Value Setting	Description
Rule Name	String: any text	Set rule name
Rule Policy	Default Inactivate	Inactivate/activate the function been applied to in the time period below

4G IIoT RTU

8	-- choose one --		

Time Period Definition		
Item	Value Setting	Description
Week Day	Select from menu	Select everyday or one of weekday
Start Time	Time format (hh :mm)	Start time in selected weekday
End Time	Time format (hh :mm)	End time in selected weekday
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings
Refresh	N/A	Click the Refresh button to refresh the time schedule list.

4G IIoT RTU

3.2 User (not supported)

Not supported feature for the purchased product, leave it as blank.

4G IIoT RTU

3.3 Grouping

The Grouping function allows user to make group for some services.

3.3.1 Host Grouping

Go to **Object Definition > Grouping > Host Grouping** tab.

The Host Grouping function allows user to make host group for some services, such as QoS, Firewall, and Communication Bus. The supported service types could be different for the purchased product.

Host Group List						
ID	Group Name	Group Type	Member List	Bound Services	Enable	Actions

When **Add** button is applied, **Host Group Configuration** screen will appear.

Host Group Configuration	
Item	Setting
▶ Group Name	<input type="text"/>
▶ Group Type	<input type="text" value="IP Address-based"/>
▶ Member to Join	<input type="text"/> <input type="button" value="Join"/>
▶ Member List	
▶ Bound Services	<input type="checkbox"/> Firewall
▶ Group	<input type="checkbox"/> Enable

Host Group Configuration		
Item	Value setting	Description
Group Name	1. String format can be any text 2. A Must filled setting	Enter a group name for the rule. It is a name that is easy for you to understand.
Group Type	1. IP Address-based is selected by default. 2. A Must filled setting	Select the group type for the host group. It can be IP Address-based , MAC Address-based , or Host Name-based . When IP Address-based is selected, only IP address can be added in Member to Join . When MAC Address-based is selected, only MAC address can be added in Member to Join .

4G IIoT RTU

		<p>When Host Name-based is selected, only host name can be added in Member to Join.</p> <p>Note: The available Group Type can be different for the purchased model.</p>
Member to Join	N/A	<p>Add the members to the group in this field.</p> <p>You can enter the member information as specified in the Member Type above, and press the Join button to add.</p> <p>Only one member can be add at a time, so you have to add the members to the group one by one.</p>
Member List	NA	This field will indicate the hosts (members) contained in the group.
Bound Services	The boxes are unchecked by default	<p>Binding the services that the host group can be applied. If you enable the Firewall, the produced group can be used in firewall service. Same as by enable QoS, or other available service types.</p> <p>Note: The supported service type can be different for the purchased product.</p>
Group	The box is unchecked by default	Check the Enable checkbox to activate the host group rule. So that the group can be bound to selected service(s) for further configuration.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

4G IIoT RTU

3.4 External Server

Go to **Object Definition > External Server > External Server** tab.

The External Server setting allows user to add external server.

Create External Server

External Server List Add Delete						
ID	Server Name	Server Type	Server IP/FQDN	Server Port	Server Enable	Actions

4G IIoT RTU

External Server Configuration		
Item	Value setting	Description
Sever Name	1. String format can be any text 2. A Must filled setting	Enter a server name. Enter a name that is easy for you to understand.
Server Type	A Must filled setting	<p>Specify the Server Type of the external server, and enter the required settings for the accessing the server.</p> <p>Email Server (A Must filled setting) : When Email Server is selected, User Name, and Password are also required. User Name (String format: any text) Password (String format: any text)</p> <p>RADIUS Server (A Must filled setting) : When RADIUS Server is selected, the following settings are also required. Primary : Shared Key (String format: any text) Authentication Protocol (By default CHAP is selected) Session Timeout (By default 1) The values must be between 1 and 60. Idle Timeout: (By default 1) The values must be between 1 and 15. Secondary : Shared Key (String format: any text) Authentication Protocol (By default CHAP is selected) Session Timeout (By default 1) The values must be between 1 and 60. Idle Timeout: (By default 1) The values must be between 1 and 15.</p> <p>FTP(SFTP) Server (A Must filled setting) : When FTP(SFTP) Server is selected, the following settings are also required. User Name (String format: any text) Password (String format: any text) Protocol (Select FTP or SFTP) Encryprion (Select Plain, Explicit FTPS or Implicit FTPS) Transfer mode (Select Passive or Active)</p>
Server IP/FQDN	A Must filled setting	Specify the IP address or FQDN used for the external server.
Server Port	A Must filled setting	<p>Specify the Port used for the external server. If you selected a certain server type, the default server port number will be set. For Email Server 25 will be set by default; For Syslog Server, port 514 will be set by default; For RADIUS Server, port 1812 will be set by default; For FTP(SFTP) Server, port 21 will be set by default; Value Range: 1 ~ 65535.</p>
Account Port	1. A Must filled setting 2. 1813 is set by default	Specify the accounting port used if you selected external RADIUS server. Value Range: 1 ~ 65535.

4G IIoT RTU

Server	The box is checked by default	Click Enable to activate this External Server.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings
Refresh	N/A	Click the Refresh button to refresh the external server list.

4G IIoT RTU

3.5 Certificate

In cryptography, a public key certificate (also known as a digital certificate or identity certificate) is an electronic document used to prove ownership of a public key. The certificate includes information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are genuine. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner⁹.

In a typical public-key infrastructure (PKI) scheme, the signer is a certificate authority (CA), usually a company such as VeriSign which charges customers to issue certificates for them. In a web of trust scheme, the signer is either the key's owner (a self-signed certificate) or other users ("endorsements") whom the person examining the certificate might know and trust. The device also plays as a CA role.

Certificates are an important component of Transport Layer Security (TLS, sometimes called by its older name SSL), where they prevent an attacker from impersonating a secure website or other server. They are also used in other important applications, such as email encryption and code signing. Here, it can be used in IPsec tunneling for user authentication.

3.5.1 Configuration

The configuration setting allows user to create Root Certificate Authority (CA) certificate and configure to set enable of SCEP. Root CA is the top-most certificate of the tree, the private key of which is used to "sign" other certificates.

Go to **Object Definition > Certificate > Configuration** tab.

Create Root CA

ID	Name	Subject	Issuer	Valid To	Action
----	------	---------	--------	----------	--------

When **Generate** button is applied, **Root CA Certificate Configuration** screen will appear. The required information to be filled for the root CA includes the name, key, subject name and validity.

3.5.2 My Certificate

My Certificate includes a Local Certificate List. Local Certificate List shows all generated certificates by the root CA for the gateway. And it also stores the generated Certificate Signing Requests (CSR) which will be signed by other external CAs. The signed certificates can be imported as the local ones of the gateway.

Self-signed Certificate Usage Scenario

Scenario Application Timing

When the enterprise gateway owns the root CA and VPN tunneling function, it can generate its own local certificates by being signed by itself or import any local certificates that are signed by other external CAs. Also import the trusted certificates for other CAs and Clients. In addition, since it has the root CA, it also can sign Certificate Signing Requests (CSR) to form corresponding certificates for others. These certificates can be used for two remote peers to make sure their identity during establishing a VPN tunnel.

Scenario Description

Gateway 1 generates the root CA and a local certificate (HQCRT) signed by itself. Import a trusted certificate (BranchCRT) –a BranchCSR certificate of Gateway 2 signed by root CA of Gateway 1.

Gateway 2 creates a CSR (BranchCSR) to let the root CA of the Gateway 1 sign it to be the BranchCRT certificate. Import the certificate into the Gateway 2 as a local certificate. In addition, also import the certificates of the root CA of the Gateway 1 into the Gateway 2 as the trusted ones. (Please also refer to following two sub-sections)

Establish an IPSec VPN tunnel with IKE and X.509 protocols by starting from either peer, so that all

4G IIoT RTU

client hosts in these both subnets can communicate with each other.

Parameter Setup Example

For Network-A at HQ

Following tables list the parameter configuration as an example for the "My Certificate" function used in the user authentication of IPSec VPN tunnel establishing, as shown in above diagram. The configuration example must be combined with the ones in following two sections to complete the whole user scenario.

Use default value for those parameters that are not mentioned in the tables.

Configuration Path	[My Certificate]-[Root CA Certificate Configuration]
Name	HQRootCA

Configuration Path	[IPSec]-[Authentication]
Key Management	<i>IKE+X.509</i> Local Certificate: <i>BranchCRT</i> Remote Certificate: <i>HQCRT</i>
Local ID	<i>User Name Network-B</i>
Remote ID	<i>User Name Network-A</i>

Configuration Path	[IPSec]-[IKE Phase]
Negotiation Mode	<i>Main Mode</i>
X-Auth	<i>None</i>

Scenario Operation Procedure

In above diagram, "Gateway 1" is the gateway of Network-A in headquarters and the subnet of its Intranet is 10.0.76.0/24. It has the IP address of 10.0.76.2 for LAN interface and 203.95.80.22 for WAN-1 interface. "Gateway 2" is the gateway of Network-B in branch office and the subnet of its Intranet is 10.0.75.0/24. It has the IP address of 10.0.75.2 for LAN interface and 118.18.81.33 for WAN-1 interface. They both serve as the NAT security gateways.

Gateway 1 generates the root CA and a local certificate (HQCRT) that is signed by itself. Import the certificates of the root CA and HQCRT into the "Trusted CA Certificate List" and "Trusted Client Certificate List" of Gateway 2.

Gateway 2 generates a Certificate Signing Request (BranchCSR) for its own certificate (BranchCRT) (Please generate one not self-signed certificate in the Gateway 2, and click on the "View" button for that CSR. Just downloads it). Take the CSR to be signed by the root CA of Gateway 1 and obtain the BranchCRT certificate (you need rename it). Import the certificate into the "Trusted Client Certificate List" of the Gateway 1 and the "Local Certificate List" of Gateway 2.

Gateway 2 can establish an IPSec VPN tunnel with "Site to Site" scenario and IKE and X.509 protocols to Gateway 1.

Finally, the client hosts in two subnets of 10.0.75.0/24 and 10.0.76.0/24 can communicate with each other.

4G IIoT RTU

My Certificate Setting

Go to **Object Definition > Certificate > My Certificate** tab.

The My Certificate setting allows user to create local certificates. In "My Certificate" page, there are two configuration windows for the "My Certificate" function. The "Local Certificate List" window shows the stored certificates or CSRs for representing the gateway. The "Local Certificate Configuration" window can let you fill required information necessary for corresponding certificate to be generated by itself, or corresponding CSR to be signed by other CAs.

Create Local Certificate

ID	Name	Subject	Issuer	Valid To	Actions
Local Certificate List <input type="button" value="Add"/> <input type="button" value="Import"/> <input type="button" value="Delete"/>					

When **Add** button is applied, **Local Certificate Configuration** screen will appear. The required information to be filled for the certificate or CSR includes the name, key and subject name. It is a certificate if the "Self-signed" box is checked; otherwise, it is a CSR.

Local Certificate Configuration	
Item	Setting
▶ Name	<input type="text"/> Self-signed : <input type="checkbox"/>
▶ Key	Key Type : <input type="text" value="RSA"/> Key Length : <input type="text" value="1024-bits"/> Digest Algorithm : <input type="text" value="SHA-1"/>

4G IIoT RTU

Local Certificate Configuration		
Item	Value setting	Description
Name	1. String format can be any text 2. A Must filled setting	Enter a certificate name. It will be a certificate file name If Self-signed is checked, it will be signed by root CA. If Self-signed is not checked, it will generate a certificate signing request (CSR).
Key	A Must filled setting	This field is to specify the key attributes of certificate. Key Type to set public-key cryptosystems. Currently, only RSA is supported. Key Length to set the length in bits of the key used in a cryptographic algorithm. It can be 512/768/1024/1536/2048. Digest Algorithm to set identifier in the signature algorithm identifier of certificates. It can be MD5/SHA-1.
Subject Name	A Must filled setting	This field is to specify the information of certificate. Country(C) is the two-letter ISO code for the country where your organization is located. State(ST) is the state where your organization is located. Location(L) is the location where your organization is located. Organization(O) is the name of your organization. Organization Unit(OU) is the name of your organization unit. Common Name(CN) is the name of your organization. Email is the email of your organization. It has to be email address setting only.
Extra Attributes	A Must filled setting	This field is to specify the extra information for generating a certificate. Challenge Password for the password you can use to request certificate revocation in the future. Unstructured Name for additional information.
SCEP Enrollment	A Must filled setting	This field is to specify the information of SCEP. If user wants to generate a certificate signing request (CSR) and then signed by SCEP server online, user can check the Enable box. Select a SCEP Server to identify the SCEP server for use. The server detailed information could be specified in External Servers. Refer to Object Definition > External Server > External Server . You may click Add Object button to generate, and the settings are the same as those defined in Section 3.4 External Server . Select a CA Certificate to identify which certificate could be accepted by SCEP server for authentication. It could be generated in Trusted Certificates. Select an optional CA Encryption Certificate , if it is required, to identify which certificate could be accepted by SCEP server for encryption data information. It could be generated in Trusted Certificates. Fill in optional CA Identifier to identify which CA could be used for signing certificates.
Save	N/A	Click the Save button to save the configuration.
Back	N/A	When the Back button is clicked, the screen will return to previous page.

4G IIoT RTU

When **Import** button is applied, an Import screen will appear. You can import a certificate from an existed certificate file, or directly paste a PEM encoded string as the certificate.

The screenshot shows a user interface for importing certificates. It features two tabs: 'Import' and 'PEM Encoded'. The 'Import' tab is currently selected and contains a '瀏覽...' (Browse...) button and the text '未選擇檔案。' (No file selected). The 'PEM Encoded' tab is also visible and contains 'Apply' and 'Cancel' buttons. Below the tabs is a large empty text area for pasting a PEM encoded string.

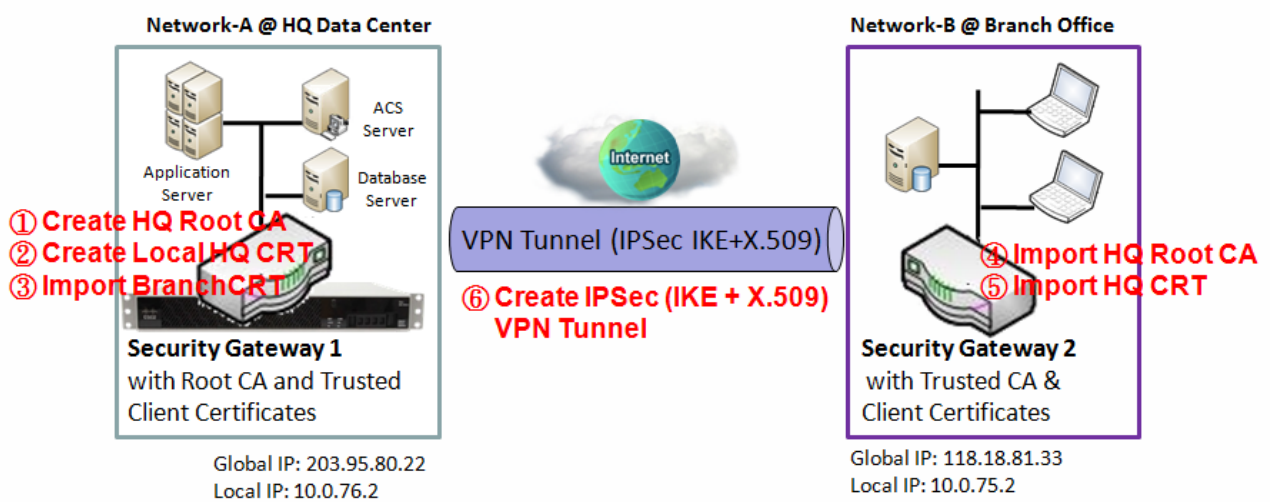

Import Item	Value setting	Description
Import	A Must filled setting	Select a certificate file from user's computer, and click the Apply button to import the specified certificate file to the gateway.
PEM Encoded	1. String format can be any text 2. A Must filled setting	This is an alternative approach to import a certificate. You can directly fill in (Copy and Paste) the PEM encoded certificate string, and click the Apply button to import the specified certificate to the gateway.
Apply	N/A	Click the Apply button to import the certificate.
Cancel	N/A	Click the Cancel button to discard the import operation and the screen will return to the My Certificates page.

4G IIoT RTU

3.5.3 Trusted Certificate

Trusted Certificate includes Trusted CA Certificate List, Trusted Client Certificate List, and Trusted Client Key List. The Trusted CA Certificate List places the certificates of external trusted CAs. The Trusted Client Certificate List places the others' certificates what you trust. And the Trusted Client Key List places the others' keys what you trusted.

Self-signed Certificate Usage Scenario

Scenario Application Timing (same as the one described in "My Certificate" section)

When the enterprise gateway owns the root CA and VPN tunneling function, it can generate its own local certificates by being signed by itself. Also imports the trusted certificates for other CAs and Clients. These certificates can be used for two remote peers to make sure their identity during establishing a VPN tunnel.

Scenario Description (same as the one described in "My Certificate" section)

Gateway 1 generates the root CA and a local certificate (HQCRT) signed by itself. Import a trusted certificate (BranchCRT) –a BranchCSR certificate of Gateway 2 signed by root CA of Gateway 1.

Gateway 2 creates a CSR (BranchCSR) to let the root CA of the Gateway 1 sign it to be the BranchCRT certificate. Import the certificate into the Gateway 2 as a local certificate. In addition, also imports the certificates of the root CA of Gateway 1 into the Gateway 2 as the trusted ones. (Please also refer to "My Certificate" and "Issue Certificate" sections).

Establish an IPSec VPN tunnel with IKE and X.509 protocols by starting from either peer, so that all client hosts in these both subnets can communicate with each other.

Parameter Setup Example (same as the one described in "My Certificate" section)

4G IIoT RTU

For Network-A at HQ

Following tables list the parameter configuration as an example for the "Trusted Certificate" function used in the user authentication of IPSec VPN tunnel establishing, as shown in above diagram. The configuration example must be combined with the ones in "My Certificate" and "Issue Certificate" sections to complete the setup for the whole user scenario.

Configuration Path	[Trusted Certificate]-[Trusted Client Certificate List]
Command Button	<i>Import</i>

Configuration Path	[Trusted Certificate]-[Trusted Client Certificate Import from a File]
File	<i>BranchCRT.crt</i>

For Network-B at Branch Office

Following tables list the parameter configuration as an example for the "Trusted Certificate" function used in the user authentication of IPSec VPN tunnel establishing, as shown in above diagram. The configuration example must be combined with the ones in "My Certificate" and "Issued Certificate" sections to complete the setup for the whole user scenario.

Configuration Path	[Trusted Certificate]-[Trusted CA Certificate List]
Command Button	<i>Import</i>

Configuration Path	[Trusted Certificate]-[Trusted CA Certificate Import from a File]
File	<i>HQRootCA.crt</i>

Configuration Path	[Trusted Certificate]-[Trusted Client Certificate List]
Command Button	<i>Import</i>

Configuration Path	[Trusted Certificate]-[Trusted Client Certificate Import from a File]
File	<i>HQCRT.crt</i>

Scenario Operation Procedure (same as the one described in "My Certificate" section)

In above diagram, the "Gateway 1" is the gateway of Network-A in headquarters and the subnet of its Intranet is 10.0.76.0/24. It has the IP address of 10.0.76.2 for LAN interface and 203.95.80.22 for WAN-1 interface. The "Gateway 2" is the gateway of Network-B in branch office and the subnet of its Intranet is 10.0.75.0/24. It has the IP address of 10.0.75.2 for LAN interface and 118.18.81.33 for WAN-1 interface. They both serve as the NAT security gateways.

In Gateway 2 import the certificates of the root CA and HQCRT that were generated and signed by Gateway 1 into the "Trusted CA Certificate List" and "Trusted Client Certificate List" of Gateway 2.

4G IIoT RTU

Import the obtained BranchCRT certificate (the derived BranchCSR certificate after Gateway 1's root CA signature) into the "Trusted Client Certificate List" of the Gateway 1 and the "Local Certificate List" of the Gateway 2. For more details, refer to the Network-B operation procedure in "My Certificate" section of this manual.

Gateway 2 can establish an IPsec VPN tunnel with "Site to Site" scenario and IKE and X.509 protocols to Gateway 1.

Finally, the client hosts in two subnets of 10.0.75.0/24 and 10.0.76.0/24 can communicate with each other.

4G IIoT RTU

Trusted Certificate Setting

Go to **Object Definition > Certificate > Trusted Certificate** tab.

The Trusted Certificate setting allows user to import trusted certificates and keys.

Import Trusted CA Certificate

ID	Name	Subject	Issuer	Valid To	Actions
----	------	---------	--------	----------	---------

When **Import** button is applied, a **Trusted CA import** screen will appear. You can import a Trusted CA certificate from an existed certificate file, or directly paste a PEM encoded string as the certificate.

Trusted CA Certificate List		
Item	Value setting	Description
Import from a File	A Must filled setting	Select a CA certificate file from user's computer, and click the Apply button to import the specified CA certificate file to the gateway.
Import from a PEM	1. String format can be any text 2. A Must filled setting	This is an alternative approach to import a CA certificate. You can directly fill in (Copy and Paste) the PEM encoded CA certificate string, and click the Apply button to import the specified CA certificate to the gateway.
Apply	N/A	Click the Apply button to import the certificate.
Cancel	N/A	Click the Cancel button to discard the import operation and the screen will return to the Trusted Certificates page.

4G IIoT RTU

Instead of importing a Trusted CA certificate with mentioned approaches, you can also get the CA certificate from the SECP server.

If **SCEP** is enabled (Refer to **Object Definition > Certificate > Configuration**), you can click **Get CA** button, a Get CA Configuration screen will appear.

Get CA Configuration	
Item	Setting
▶ SCEP Server	<input type="text" value="--- Option ---"/> <input type="button" value="Add Object"/>
▶ CA Identifier	<input type="text"/> (Optional)

Get CA Configuration		
Item	Value setting	Description
SCEP Server	A Must filled setting	Select a SCEP Server to identify the SCEP server for use. The server detailed information could be specified in External Servers. Refer to Object Definition > External Server > External Server . You may click Add Object button to generate.
CA Identifier	1. String format can be any text	Fill in optional CA Identifier to identify which CA could be used for signing certificates.
Save	N/A	Click Save to save the settings.
Close	N/A	Click the Close button to return to the Trusted Certificates page.

Import Trusted Client Certificate

Trusted Client Certificate List					
ID	Name	Subject	Issuer	Vaild To	Actions
<input type="button" value="Import"/> <input type="button" value="Delete"/>					

When **Import** button is applied, a **Trusted Client Certificate Import** screen will appear. You can import a Trusted Client Certificate from an existed certificate file, or directly paste a PEM encoded string as the certificate.

4G IIoT RTU

3.5.4 Issue Certificate (not supported)

Not supported feature for the purchased product, leave it as blank.

Chapter 4 Field Communication

4.1 Bus & Protocol

The gateway may equip one or more serial port(s) for various serial communication use through connecting the RS-232 or RS-485 serial devices to an IP-based Ethernet LAN. These communication protocols make user access serial devices anywhere over a local LAN or the Internet easily. They can be "Virtual COM" and "Modbus".

4.1.1 Port Configuration

Before using the supported field communication function, like Virtual COM or Modbus, you need to configure the physical communication port first.

The port configuration screen allows user to configure the operation mode and physical layer settings for each serial interface, and also can quick switch from one communication protocol to another for the serial port. The number of ports and type of the supported protocols could be different for the purchased gateway model.

4G IIoT RTU

Port Configuration Setting

Go to **Field Communication > Bus & Protocol > Port Configuration** tab.

In "Port Configuration" page, there is only one configuration window for the serial port settings. The "Configuration" window can let you specify serial port parameters including the operation mode being "Virtual COM", "Modbus" or disabled, the interface, the baud rate, the data bit length, the stop bit length, the flow control being "RTS/CTS", "DTS/DSR" or "None", and the parity.

Serial Port Definition								
Serial Port	Operation Mode	Interface	Baud Rate	Data Bits	Stop Bits	Flow Control	Parity	Action
SPort-0	Disable	RS-232	9600	8	1	None	None	<input type="button" value="Edit"/>

Port Configuration Window		
Item	Value setting	Description
Serial Port	N/A	It displays the serial port ID of the serial port. The number of serial ports varies from the purchased model.
Operation Mode	Disable is set by default	Select the operation mode for the serial interface. The available modes can be Disable, Virtual COM or Modbus.
Interface	RS-232 is set by default	Select the physical interface type for connecting to the access device(s) with the same interface specification. Depending on the purchase model, the supported interface type could be RS-232 or RS-485.
Baud Rate	9600 is set by default	Select the appropriate baud rate for serial device communication. RS-232: 1200 / 2400 / 4800 / 9600 / 19200 / 38400 / 57600 / 115200 RS-485 can use higher baud rate for 230400 and 460800. It depends on the cable length and the installed environment. The longer cable, the lower baud rate for it.
Data Bits	8 is set by default	Select 8 or 7 for data bits.
Stop Bits	1 is set by default	Select 1 or 2 for stop bits.
Flow Control	None is set by default	Select None / RTS, CTS / DTS, DSR for Flow Control in RS-232 mode. The supporting of Flow Control depends on the purchased model.
Parity	None is set by default	Select None / Even / Odd for Parity bit.
Action	N/A	Click Edit button to change the operation mode, or modify the parameters mentioned above for the serial interface communication.
Save	N/A	Click Save button to save the settings.
Undo	N/A	Click Undo button to cancel the settings.

4G IIoT RTU

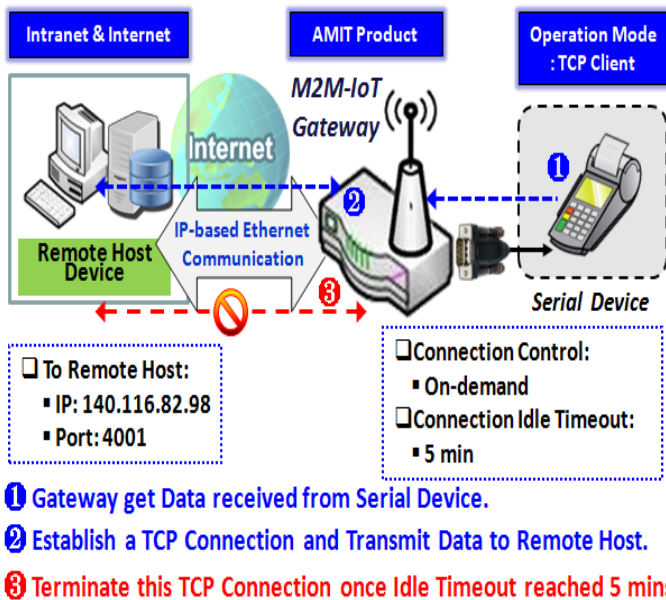

4.1.2 Virtual COM

Create a virtual COM port on user’s PC/Host to provide access to serial device connected to the serial port on gateway. Therefore, users can access, control, and manage the connected serial device through Internet (fixed line, or cellular network) anywhere. This application is also known as Ethernet pass-through communication.

Operation Mode Definition for each Serial Port									
Serial Port	Operation Mode	Listen Port	Trust Type	Max Connection	Connection Control	Connection Idle Timeout	Alive Check Timeout	Enable	Action
SPort-0	Disable	N/A	N/A	N/A	N/A	N/A	N/A	<input type="checkbox"/>	Edit

Virtual COM setting screen enables user to connect a Virtual COM port based device to the Internet. It allows user to access serial data remotely. There are Disable, TCP Client, TCP Server, UDP, and RFC2217 modes for remote accessing the connected serial device. These operation modes are illustrated as below.

TCP Client Mode

When the administrator expects the gateway to actively establish a TCP connection to a pre-defined host computer when serial data arrives, the operation mode for the "Virtual COM" function is required to be "TCP Client" and when the connection control of virtual COM is "On-demand", once the gateway receives data from the connected serial device, it will establish a TCP connection to transfer the received serial data to the remote host. Besides, after the data has been transferred, the gateway automatically disconnects the established TCP session from the host computer by using the TCP alive check timeout or idle timeout settings.

4G IIoT RTU

TCP Server Mode

- ① Gateway remain Listening and Host will Establish a TCP Connection with it.
- ② Host Send Data then Gateway Transmit it to the Serial Device.
- ③ Terminate this TCP Connection once Idle Timeout reached 5 mins.

When the administrator expects the gateway to wait passively for the serial data requests from the Host Device (usually we use a computer to play as a Host), and the Host will establish a TCP connection to get data from the serial device, the operation mode for the "Virtual COM" function is required to be "TCP Server". In this mode, the gateway provides a unique "IP: Port" address on a TCP/IP network. It supports up to 4 simultaneous connections, so that multiple hosts can collect data from the same serial device at the same time. After the data has been transferred, the TCP connection will be automatically disconnected from the host computer by using the TCP alive check timeout or idle timeout settings.

UDP Mode

Data is Transferred between Remote Host and Serial Device Directly

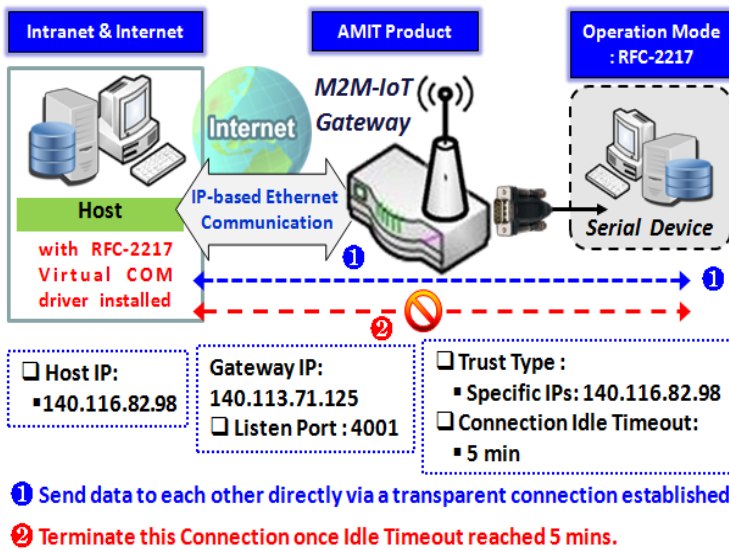

to 4 legal hosts to connect simultaneously to the serial device via the gateway.

If both the Remote Host Computer and the serial device are expected to initiate a data transfer when it requires doing that, the operation mode for the "Virtual COM" function in the gateway is required to be "UDP". In this mode, the UDP data can be transferred between the gateway and multiple host computers from either peer, making this mode ideal for message display applications.

The remote host computer can directly send UDP data to the serial device via the gateway, and also receive UDP data from the serial device via the gateway at the same time. The gateway supports up to 4 legal hosts to connect simultaneously to the serial device via the gateway.

4G IIoT RTU

RFC-2217 Mode

RFC-2217 defines general COM port control options based on telnet protocol. A host computer with RFC-2217 driver installed can monitor and manage the remote serial device attached to the gateway's serial port, as though they were connected to the local serial port. When a virtual serial port on the local serial device is being created, it is required to specify the IP-address of the host computers to establish connection with.

Any 3rd party driver supporting RFC2217 can be used to install in the host computer, the driver establishes a transparent connection between host and serial device by mapping the IP:Port of the gateway's serial port to a virtual local COM

port on the host computer.

The host computer can directly send data to the serial device via the gateway, and also receive data from the serial device via the gateway at the same time. The gateway supports up to 4 Internet host computers.

4G IIoT RTU

Virtual COM Setting

Virtual COM setting screen enables user to connect a Virtual COM port based device to the Internet. It allows user to access serial data remotely. There are Disable, TCP Client, TCP Server, UDP, and RFC2217 modes for remote accessing the connected serial device. By default, it is configured in Disable mode.

To use the Virtual COM function, you have to specify the operation mode for the multi-function serial port first. Go to **Field Communication > Bus & Protocol > Port Configuration** tab, select the Virtual COM as expected operation mode, and finish the related port configuration as well.

After that, go to **Field Communication > Bus & Protocol > Virtual COM** tab for detailed configuration of Virtual COM setting.

Enable TCP Client Mode

Configure the gateway as the TCP (Transmission Control Protocol) Client. In TCP Client mode, device initiates a TCP connection with a TCP server when there is data to transmit. Device disconnects from the server when the connection is Idle for a specified period. You may also enable full time connection with the TCP server.

Operation Mode Definition for each Serial Port									
Serial Port	Operation Mode	Listen Port	Trust Type	Max Connection	Connection Control	Connection Idle Timeout	Alive Check Timeout	Enable	Action
SPort-0	TCP Client ▼	4001 (1~65535)	Allow All ▼	1	Always on ▼	0 (0-3600secs)	0 (0-3600secs)	<input type="checkbox"/>	Edit

Enable TCP Client Mode Window		
Item	Value setting	Description
Operation Mode	A Must filled setting	Select TCP Client .
Connection Control	Always on is set by default	Choose Always on for a TCP full time connection. Otherwise, choose On-Demand to initiate TCP connection only when required to transmit and disconnect at idle timeout.
Connection Idle Timeout	1. 0 is set by default 2. Range 0 to 3600 sec.	Enter the idle timeout in minutes. The idle timeout is used to disconnect the TCP connection when idle time elapsed . Idle timeout is only available when On-Demand is selected in the Connection Control field. Value Range: 0 ~ 3600 seconds.
Alive Check Timeout	1. 0 is set by default 2. Range 0 to 3600 sec.	Enter the time period of alive check timeout. The TCP connection will be terminated if it doesn't receive response of alive-check longer than this timeout setting Alive check timeout is only available when On-Demand is selected in the Connection Control field. Value Range: 0 ~ 3600 seconds.
Enable	The box is unchecked by default.	Check the Enable box to activate the corresponding serial port in specified operation mode.
Save	N/A	Click the Save button to save the configuration

Specify Data Packing Parameters

Data Packing (for TCP Client, TCP Server and UDP operation mode)

Serial Port	Data Buffer Length	Delimiter Character 1	Delimiter Character 2	Data Timeout Transmit
SPort-0	<input type="text" value="0"/> (0~1024)	<input type="text" value="0"/> (Hex) <input type="checkbox"/> Enable	<input type="text" value="0"/> (Hex) <input type="checkbox"/> Enable	<input type="text" value="0"/> (0~1000ms)

Data Packing Configuration		
Item	Value setting	Description
Data Buffer Length	1.An optional filled setting 2.Default value is 0	Enter the data buffer length for the serial port. Value Range: 0 ~ 1024.
Delimiter Character 1	1.An optional filled setting 2.Default value is 0	Check the Enable box to activate the Delimiter character 1, and enter the Hex code for it. Value Range: 0x00 ~ 0xFF.
Delimiter Character 2	1.An optional filled setting 2.Default value is 0	Check the Enable box to activate the Delimiter character 2, and enter the Hex code for it. Value Range: 0x00 ~ 0xFF.
Data Timeout Transmit	1.An optional filled setting 2.Default value is 0	Enter the data timeout interval for transmitting serial data through the port. By default, it is set to 0 and the timeout function is disabled. Value Range: 0 ~ 1000ms.
Save	N/A	Click the Save button to save the configuration

Specify Remote TCP Server

Legal Host IP/ FQDN Definition (for TCP Client operation mode)

ID	To Remote Host	Remote Port	Serial Port	Definition Enable	Action
1		4001	SPort-0	<input type="checkbox"/>	<input type="button" value="Edit"/>
2		4001	SPort-0	<input type="checkbox"/>	<input type="button" value="Edit"/>
3		4001	SPort-0	<input type="checkbox"/>	<input type="button" value="Edit"/>
4		4001	SPort-0	<input type="checkbox"/>	<input type="button" value="Edit"/>

Specify TCP Server Window		
Item	Value setting	Description
To Remote Host	A Must filled setting	Press Edit button to enter IP address or FQDN of the remote TCP server to transmit serial data.
Remote Port	1.A Must filled setting 2.Default value is 4001	Enter the TCP port number. This is the listen port of the remote TCP server. Value Range: 1 ~ 65535.
Serial Port	SPort-0 is set by default	Apply the TCP server connection for a selected serial port. Up to 4 TCP servers can be configured at the same time for each serial port.
Definition Enable	The box is unchecked by default	Check the Enable box to enable the TCP server configuration.
Save	N/A	Click the Save button to save the configuration

4G IIoT RTU

Enable TCP Server Mode

Configure the gateway as the TCP (Transmission Control Protocol) Server. The TCP Server waits for connections to be initiated by a remote TCP client device to receive serial data. The setting allows user to specify specific TCP clients or allow any to send serial data for serial data transmission bandwidth control and access control. The TCP Server supports up to 128 simultaneous connections to receive serial data from multiple TCP clients.

Operation Mode Definition for each Serial Port									
Serial Port	Operation Mode	Listen Port	Trust Type	Max Connection	Connection Control	Connection Idle Timeout	Alive Check Timeout	Enable	Action
SPort-0	TCP Server ▼	4001 (1~65535)	Allow All ▼	1	Always on ▼	0 (0-3600secs)	0 (0-3600secs)	<input type="checkbox"/>	Edit

Enable TCP Server Mode Window		
Item	Value setting	Description
Operation Mode	A Must filled setting	Select TCP Server mode.
Listen Port	4001 is set by default	Indicate the listening port of TCP connection. Value Range: 1 ~ 65535.
Trust Type	Allow All is set by default	Choose Allow All to allow any TCP clients to connect. Otherwise choose Specific IP to limit certain TCP clients.
Max Connection	1. Max. 128 connections 2. 1 is set by default	Set the maximum number of concurrent TCP connections. Up to 128 simultaneous TCP connections can be established. Value Range: 1 ~ 128.
Connection Idle Timeout	1. 0 is set by default 2. Range 0 to 3600 sec.	Enter the idle timeout in minutes. The idle timeout is used to disconnect the TCP connection when idle time elapsed . Idle timeout is only available when On-Demand is selected in the Connection Control field. Value Range: 0 ~ 3600 seconds.
Alive Check Timeout	1. 0 is set by default 2. Range 0 to 3600 sec.	Enter the time period of alive check timeout. The TCP connection will be terminated if it doesn't receive response of alive-check longer than this timeout setting Alive check timeout is only available when On-Demand is selected in the Connection Control field. Value Range: 0 ~ 3600 seconds.
Enable	The box is unchecked by default.	Check the Enable box to activate the corresponding serial port in specified operation mode.
Save	N/A	Click Save button to save the settings.

4G IIoT RTU

Specify TCP Clients for TCP Server Access

If you selected **Specific IPs** as the trust Type, the Trusted IP Definition window appears. The settings are valid for both TCP Server and RFC-2217 modes.

Trusted IP Definition (for TCP Server & RFC-2217 operation mode)				
ID	Host	Serial Port	Definition Enable	Action
1			<input type="checkbox"/>	Edit
2			<input type="checkbox"/>	Edit
3			<input type="checkbox"/>	Edit
4			<input type="checkbox"/>	Edit
5			<input type="checkbox"/>	Edit
6			<input type="checkbox"/>	Edit
7			<input type="checkbox"/>	Edit
8			<input type="checkbox"/>	Edit

Specify TCP Clients Window		
Item	Value setting	Description
Host	A Must filled setting	Enter the IP address range of allowed TCP clients.
Serial Port	The box is unchecked by default	Check the box to specify the rule for selected Serial Port.
Definition Enable	The box is unchecked by default	Check the Enable box to enable the rule.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

4G IIoT RTU

Enable UDP Mode

UDP (User Datagram Protocol) enables applications using UDP socket programs to communicate with the serial ports on the serial server. The UDP mode provides connectionless communications, which enable you to multicast data from the serial device to multiple host computers, and vice versa, making this mode ideal for message display applications.

Operation Mode Definition for each Serial Port									
Serial Port	Operation Mode	Listen Port	Trust Type	Max Connection	Connection Control	Connection Idle Timeout	Alive Check Timeout	Enable	Action
SPort-0	UDP	4001 (1~65535)	Allow All	1	Always on	0 (0-3600secs)	0 (0-3600secs)	<input type="checkbox"/>	Edit

Enable UDP Mode Window		
Item	Value setting	Description
Operation Mode	A Must filled setting	Select UDP mode.
Listen Port	4001 is set by default	Indicate the listening port of UDP connection. Value Range: 1 ~ 65535
Enable	The box is unchecked by default.	Check the Enable box to activate the corresponding serial port in specified operation mode.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

Specify Remote UDP

Legal Host IP Definition (for UDP operation mode)					
ID	Remote Host	Remote Port	Serial Port	Definition Enable	Action
1		4001	SPort-0	<input type="checkbox"/>	Edit
2		4001	SPort-0	<input type="checkbox"/>	Edit
3		4001	SPort-0	<input type="checkbox"/>	Edit
4		4001	SPort-0	<input type="checkbox"/>	Edit

Specify Remote UDP hosts Window		
Item	Value setting	Description
Host	A Must filled setting	Press Edit button to enter IP address range of remote UDP hosts.
Remote Port	4001 is set by default	Indicate the UDP port of peer UDP hosts. Value Range: 1 ~ 65535
Serial Port	SPort-0 is set by default	Apply the UDP hosts for a selected serial port. Up to 4 UDP servers can be configured at the same time for each serial port.
Definition Enable	The box is unchecked by default	Check the Enable box to enable the rule.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

4G IIoT RTU

Enable RFC-2217 Mode

RFC-2217 defines general COM port control options based on telnet protocol. With the RFC-2217 mode, remote host can monitor and manage remote serially attached devices, as though they were connected to the local serial port. When a virtual serial port on the local serial device is being created, it is required to specify the IP-address of the remote hosts to establish connection with.

Operation Mode Definition for each Serial Port									
Serial Port	Operation Mode	Listen Port	Trust Type	Max Connection	Connection Control	Connection Idle Timeout	Alive Check Timeout	Enable	Action
SPort-0	RFC-2217 ▼	4001 (1~65535)	Allow All ▼	1	Always on ▼	0 (0-3600secs)	0 (0-3600secs)	<input type="checkbox"/>	Edit

Enable RFC-2217 Mode Window		
Item	Value setting	Description
Operation Mode	A Must filled setting	Select RFC-2217 mode.
Listen Port	4001 is set by default	Indicate the listening port of RFC-2217 connection. Value Range: 1 ~ 65535
Trust Type	Allow All is set by default	Choose Allow All to allow any clients to connect. Otherwise choose Specific IP to limit certain clients.
Connection Idle Timeout	1. 0 is set by default 2. Range 0 to 3600 sec.	Enter the idle timeout in minutes. The idle timeout is used to disconnect the TCP connection when idle time elapsed . Idle timeout is only available when On-Demand is selected in the Connection Control field. Value Range: 0 ~ 3600 seconds.
Alive Check Timeout	1. 0 is set by default 2. Range 0 to 3600 sec.	Enter the time period of alive check timeout. The TCP connection will be terminated if it doesn't receive response of alive-check longer than this timeout setting Alive check timeout is only available when On-Demand is selected in the Connection Control field. Value Range: 0 ~ 3600 seconds.
Enable	The box is unchecked by default.	Check the Enable box to activate the corresponding serial port in specified operation mode.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

4G IIoT RTU

4.1.3 Modbus

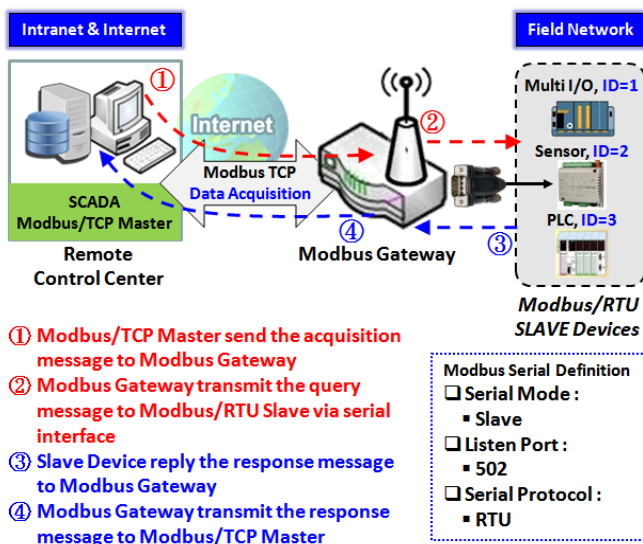

Modbus is one of the most popular automation protocols in the world, supporting traditional RS-232/422/485 devices and recently developed Ethernet devices. Many industrial devices, such as PLCs, DCSs, HMIs, instruments, and smart meters, use Modbus protocol as the communication standard. It is used to establish master-slave communication between intelligent devices.

However, the Ethernet-based Modbus protocol is so different from the original serial-based protocols. In order to integrate Modbus networks, the IoT Gateway, including one or more serial ports that support RS-232 and RS-485 communication interface, can automatically and intelligently translate between Modbus TCP (Ethernet) and Modbus RTU/ASCII (serial) protocols, allowing Ethernet-based PLCs to control instruments over RS-485 without additional programming or effort.

Serial Port Definition								
Serial Port	Operation Mode	Interface	Baud Rate	Data Bits	Stop Bits	Flow Control	Parity	Action
SPort-0	Modbus	RS-485	9600	8	1	None	None	Edit

NOTE: When Modbus devices are connected to/under the same serial port of IoT Modbus Gateway, those Modbus devices must use the same protocol with the same configuration (i.e., either Modbus RTU or Modbus ASCII with same Baud Rate setting).

Modbus Gateway Scenario

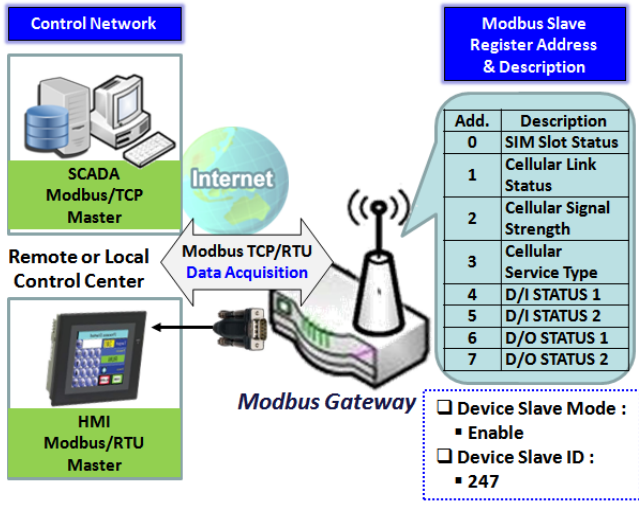

The IoT Gateway serves as a Modbus gateway to communicate with the Modbus TCP Master, the SCADA Server, located at remote control center for Modbus device accessing.

The Modbus TCP Master requests the IoT Gateway for Modbus devices' information, e.g., Data Acquisition or Register/Value Modification, via general Internet accessing, and the IoT Gateway serves as the gateway for data forwarding.

Under such configuration, the Modbus TCP Master requests the information from or sending control commands to various Modbus/RTU Slave devices that attached to the Modbus Gateway. And the Modbus gateway executes corresponding processes and replies the Modbus/TCP Master with the results.

4G IIoT RTU

Modbus Slave Scenario

In addition to behave as a Modbus Gateway, there is an integrated Modbus Slave option for providing some device status, like Cellular Network Status, device DI/DO status, to remote Modbus Master via Modbus communication.

With the Slave option enabled, the Modbus Master device can request the information or sending control commands to the IoT Gateway, the Modbus TCP/RTU Slave device. And IoT Gateway executes corresponding processes and replies the Modbus Master devices.

4G IIoT RTU

Modbus Setting

Go to **Field Communication > Bus & Protocol > Modbus** tab.

The Modbus setting page enables user to configure the gateway to operate as a Modbus gateway, and allow access among Modbus TCP devices (which are connected to Ethernet network) and Modbus RTU/ASCII devices (which are connected to the Serial Port of the gateway). Once completed the Modbus settings in this section, ensure to select Modbus Operation Mode in Port Configuration screen to enable Modbus communication on the serial port.

Define Modbus Gateway function for each Serial Port

Modbus Gateway Definition						
Serial Port	Gateway Mode	Device Slave Mode	Listen Port	Serial Protocol	Enable	Action
▶ SPort-0	Disable	Slave Mode: Disable	502	RTU	<input checked="" type="checkbox"/>	Edit

Modbus Gateway Definition		
Item	Value setting	Description
Serial Port	N/A	It displays the name of the serial port used. E.g. SPort-0. The number of serial ports varies from the purchased model.
Gateway Mode	Disable is set by default	Specify the Modbus gateway mode for the selected serial port. It can be Disable , Serial as Slave or Serial as Master . A serial port can be attached with one Modbus Master, or daisy-chained a group of Modbus Slave devices. Disable: Select this to disable the respective Modbus gateway function for the selected serial port. Serial as Slave: Select this when the attached serial device(s) are all Modbus Slave devices. Serial as Master: Select this when the attached serial device is a Modbus Master device.
Device Slave Mode	Disable is set by default	Check the Enable box to activate the integrated Modbus Slave function, and enter the preferred ID for the integrated Modbus slave. So that, it can function as a Modbus Slave device, and can be accessed with legacy Modbus Function Code from a SCADA management system. Supported Modbus commands are listed in the following Table. Value Range: 1 ~ 247.
Listen Port	1. 502 is set by default 2. Range 1 to 65535	Specify the Listen Port number if Slave device(s) is attached to the selected serial port. It is a don't care setting if a Master device is attached. Value Range: 1 ~ 65535.

4G IIoT RTU

		Note: Use different port number among the serial ports for the product with multiple serial ports.
Serial Protocol	RTU is set by default	Select the serial protocol that is adopted by the attached Modbus device(s). It can be RTU or ASCII .
Enable	N/A	It displays whether the specific Modbus serial port is enabled or disabled. To enable or disable Modbus serial port, go to Field Communication > Bus & Protocol > Port Configuration tab, and set the operation mode as Modbus .

Specify Gateway Configuration

Gateway Mode Configuration for SPort-0	
Item	Setting
▶ Response Timeout	<input type="text" value="1000"/> ms (1~65535)
▶ Timeout Retries	<input type="text" value="0"/> times (0~5)
▶ 0Bh Exception	<input type="checkbox"/> Enable
▶ Tx Delay	<input type="checkbox"/> Enable
▶ TCP Connection Idle Time	<input type="text" value="300"/> sec (1~65535)
▶ Maximum TCP Connections	<input type="text" value="1"/> connections (1~4)
▶ TCP Keep-alive	<input type="checkbox"/> Enable
▶ Modbus Master IP Access	<input type="text" value="Allow All"/> ▼
▶ Message Buffering	<input type="checkbox"/> Enable

Gateway Mode Configuration for SPort-n		
Item	Value setting	Description
Response Timeout	1000 ms is set by default	This sets the response timeout of the slave after master request sent. If the slave does not response within the specified time, data would be discarded. This applies to the serially attached Master sent request over to the remote Slave or requests send from the remote Master sent to the serially attached Slave. Value Range: 1 ~ 65535.
Timeout Retries	0 is set by default	If the slave does not respond to the Master's request, the gateway will resend the request stored in the buffer. If Timeout retries is set to null (value zero), the gateway would not buffer Master requests. If a value other than zero is specified, the gateway would store the Master request in the buffer and retries to send the request in a number of specified times. Once the retries are exhausted, the gateway will send a Modbus error message to the Master. However, if the 0Bh exception box is checked (see below), a 0Bh hex code based-error message will be send instead. Value Range: 0 ~ 5.

4G IIoT RTU

0Bh Exception	The box is unchecked by default.	Check the Enable box to enable gateway to send a 0Bh exception code message to Modbus Master to indicate that the slave device does not respond within the timeout interval.
Tx Delay	The box is unchecked by default.	Check the Enable box to activate to the minimum amount of time after receiving a response before the next message can be sent out. When Tx Delay is enabled the Gateway would insert a Tx delay between Master requests. The delay gives sufficient time for the slave devices to turn their transmitters off and their receivers back on.

Setup TCP/IP Connection for Receiving Modbus Master Request

The following Modbus TCP Configuration items allow user to set up the TCP connection settings so that the remote Modbus Master can access to the Modbus gateway. Besides, it also allows user to specify authorized masters on the TCP network.

Item	Value setting	Description
TCP Connection Idle Time	1. 300 is set by default 2. Range 1 to 65535	Enter the idle timeout in seconds. If the gateway does not receive another TCP request before the idle timeout elapsed, the TCP session will be terminated automatically. Value Range: 1 ~ 65535.
Maximum TCP Connections	1. 4 is set by default 2. Range 1 to 4	Enter the allowed maximum simultaneous TCP connections. Value Range: 1 ~ 4.
TCP Keep-alive	The box is unchecked by default.	Check the Enable box to ensure to keep the TCP session connected.
Modbus Master IP Access	Allow All is selected by default.	Specify authorized masters on the TCP network. Select Allow All to allow any Modbus Master to reach the attached Slave(s). Otherwise, limit only specific Master to reach the Slave(s) by selecting Specific IPs . When Specific IPs is selected, a Trusted IP Definition dialog will appear.

Specify Trusted Modbus Masters on the TCP network

When **Specific IPs** is selected, user has to specify the Master(s) by their IP addresses to reach the serially attached Slave(s).

▶ Modbus Master IP Access	Specific IPs ▼			
▶ Trusted IP Definition	ID	Source IP	Enable	Action
	1	Specific IP Address ▼ <input type="text"/>	<input type="checkbox"/>	Edit
	2	<input type="text"/>	<input type="checkbox"/>	Edit
	3	<input type="text"/>	<input type="checkbox"/>	Edit
	4	<input type="text"/>	<input type="checkbox"/>	Edit

4G IIoT RTU

Item	Value setting	Description
Source IP	A Must fill setting	<p>Select Specific IP Address to only allow an IP address of the allowed Master to access the attached Slave(s).</p> <p>Select IP Range to only allow a set range of IP addresses of the allowed Master to access the attached Slave(s).</p> <p>Select IP Address-based Group to only allow pre-defined group of IP address of the allowed Master to access the attached Slave(s).</p> <p>Note: group must be pre-defined before this selection become available. Refer to Object Definition > Grouping > Host grouping. You may also access to create a group by the Add Rule shortcut button. Setting done through the Add Rule button will also appear in the Host grouping setting screen.</p> <p>Then check Enable box to enable this rule.</p>
Enable	Unchecked by default	Check the Enable box to enable this rule.

Modbus Priority Definition

Message Buffering must be enabled to prioritize Master request queue to transmit to Modbus Slave as mentioned in the above. Click the **Edit** button to fill in the priority settings.

▶ Message Buffering	<input checked="" type="checkbox"/> Enable			
▶ Modbus Priority Definition	Modbus Priority	Priority Base	Enable	Action
	▶ Modbus Priority 1	IP Address ▼ <input type="text"/>	<input type="checkbox"/>	Edit
	▶ Modbus Priority 2		<input type="checkbox"/>	Edit
	▶ Modbus Priority 3		<input type="checkbox"/>	Edit
	▶ Modbus Priority 4		<input type="checkbox"/>	Edit

Item	Value setting	Description
Message Buffering	<ol style="list-style-type: none"> 1. Unchecked by default 2. Buffer up to 32 requests 	<p>Check the Enable box to buffer up to 32 requests from Modbus Master.</p> <p>If the Enable box is checked, a Modbus Priority Definition dialog will appear consequently. So that, the buffered Master requests can further be configured to prioritize request queue to transmit to Slave based on Master's IP address if requests are coming from remote Master, or based on remote Slave ID if requests are coming from serially attached Master, or based on Function Code.</p>
Modbus Priority	N/A	A Priority List for setting the priority of specified Modbus identity. Modbus Priority 1 ~ Modbus Priority 4.
Priority Base	IP Address by Default	<p>User can specify a Modbus identity with IP Address, Slave ID, or Function Code.</p> <p>The buffered Modbus message that matched the specified identity will be handled with given priority.</p> <p>The Modbus Master requests can be buffered to a certain priority queue according to the Master's IP address if requests are coming from remote Master, or the remote Slave's device ID if requests are coming from serially attached</p>

4G IIoT RTU

		Master, or the specific Function Code that issued by Master.
Enable	Unchecked by default	Check the Enable box to enable the priority settings.
Save	N/A	Click the Save button to save the settings.

Specify Modbus TCP Slave device(s)

If there is a Modbus Master device is attached to a certain serial port of the Modbus Gateway, user has to further specify the Modbus TCP Slave device(s) to send requests to from the attached Modbus RTU/ASCII Master device.

Modbus TCP Slave List for SPort-0					
<input type="button" value="Add"/> <input type="button" value="Delete"/>					
ID	IP	Port	ID Range	Enable	Actions

When the **Add** button is applied, a **Modbus TCP Slave Configuration** screen will appear.

Modbus TCP Slave Configuration for SPort-0	
Item	Setting
▶ IP	<input type="text"/>
▶ Port	<input type="text"/> (1~65535)
▶ ID Range	<input type="text"/> (1~247) ~ <input type="text"/> (1~247)
▶ Enable	<input type="checkbox"/>

Modbus Remote Slave Configuration		
Item	Value setting	Description
IP	A Must fill setting	Enter the IP address of the remote Modbus TCP Slave device.
Port	1. A Must fill setting 2. Range 1 to 65535	Enter the TCP port on which the remote Modbus TCP Slave device listens (to the TCP client session request). Value Range: 1 ~ 65535.
ID Range	Range 1 to 247	Enter the Modbus ID range for the Modbus TCP Slave(s) that will respond to the Master's request. In addition to specify the Slave IP and Port, for accessing those Remote Modbus RTU Slave(s) located behind another Modbus Gateway, user has to specify the Modbus ID range of the Modbus RTU Slave(s). Value Range: 1 ~ 247.
Enable	It is unchecked by default.	Check the Enable box to enable this rule.
Save	N/A	Click the Save button to save the settings.

4G IIoT RTU

Supported Function Code for Integrated Modbus Slave

This setting can setup the Gateway as a standalone Modbus Slave Device. Local SCADA Management System can treat the Gateway as a Slave device, and hence is able to read its information for device monitoring.

Currently, the integrated Modbus Slave device supports the following commands for accessing the 3G/4G Modem Status of the Gateway.

Function Code: 0x03(/Read). 0x06(/Write)

Address: 0 ~ 9999

Register Address	Register Name	R / W	Register Range / Description
0	WAN-1 Connection Status	R	0 ~ 6, 0=Disconnected, 1=Connecting..., 2=Connected, 3=Disconnecting..., 5=Wait for Traffic..., 6=Disconnected
1	WAN-2 Connection Status	R	0 ~ 6, 0=Disconnected, 1=Connecting..., 2=Connected, 3=Disconnecting..., 5=Wait for Traffic..., 6=Disconnected
2	WAN-3 Connection Status	R	0 ~ 6, 0=Disconnected, 1=Connecting..., 2=Connected, 3=Disconnecting..., 5=Wait for Traffic..., 6=Disconnected
3	WAN-4 Connection Status	R	0 ~ 6, 0=Disconnected, 1=Connecting..., 2=Connected, 3=Disconnecting..., 5=Wait for Traffic..., 6=Disconnected
10	3G/4G_SERVICE_TYPE	R	0 ~ 7, 0=2G, 1=none, 2=3G, 3=3.5G, 4~6=3.75G, 7=LTE
11	3G/4G_LINK_STATUS	R	0 ~ 6, 0=Disconnected, 1=Connecting..., 2=Connected, 3=Disconnecting..., 5=Wait for Traffic..., 6=Disconnected
12	3G/4G_SIGNAL_STRENGTH	R	0 ~ 100
13	3G/4G_SIM_STATUS	R	0 : SIM card with PIN code insert 1 : SIM card ready 2 : No SIM card
14	3G/4G_MCC	R	MCC Value
15	3G/4G_MNC	R	MNC Value
16	3G/4G_CS Register Status	R	0 : Unregistered, 1: Registered

4.2 Data Logging

Data logging is the process of collecting and storing data over a period of time in order to analyze specific trends or record the data-based events/actions of a system, or connected devices. Data logging function is a very useful and also important feature for SCADA telemetry; it makes the monitoring and analyzing tasks easier by checking the status and historical data during whole data acquisition period.

Even facing the network connection problems with remote NOC/SCADA side, you can also enable the data logging proxy function provided by the purchased gateway and keep doing the data acquisition and storing the collected data in local storage (in .CSV file format). When the network connection recovered, admin/user can download the data log files manually via FTP or web UI for further reference and maintenance.

The Modbus Cellular Gateway provides a complete data logging function for collecting the Modbus transaction data for application requirements. There are some data logging schemes to meet different management requirements. They are the Sniffer Mode, Offline Proxy Mode, Full-Time Proxy Mode, and the mixed modes for sniffer and proxy combinations.

With the Sniffer mode enabled, the gateway will monitor and record the communication among a specific Modbus Master and related slaves. It will store the Modbus communication as log files and administrator can check what Modbus communication went over the Modbus gateway, and if there is any communication loss

4G IIoT RTU

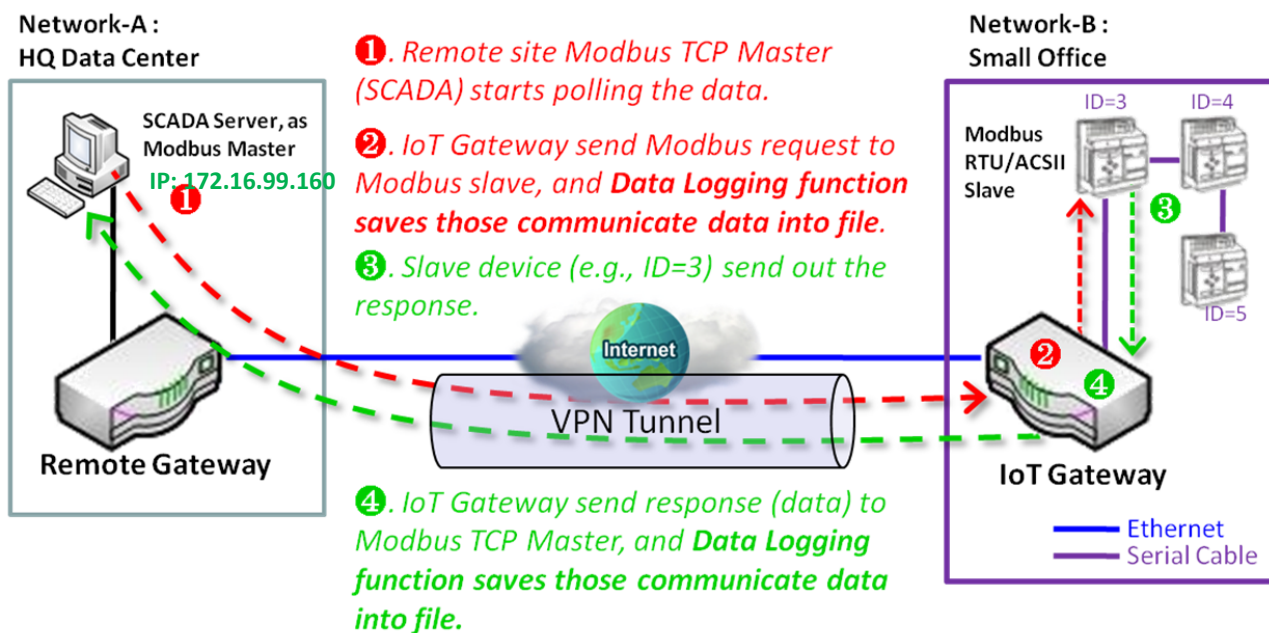

among the Master and Slave sides or not.

However, if there is any network connection problem between the Modbus gateway and remote NOC/SCADA, the remote Modbus server can't reach the Slave devices attached to the Modbus gateway, and consequently, nothing can be monitored and stored under such situation.

With the Proxy mode option enabled, when the Modbus gateway lost the connection with specified Modbus server, it will take over the data acquisition task and keep collecting the required data from Slave devices automatically. Once the connection is recovered, the Modbus gateway may stop the data log proxy function. Remote Modbus server can keep its data acquisition process, and if required, the administrator can also get the stored data log files to tell if everything goes well or not.

Under the Data Logging Proxy mode, user has to create some data acquisition rules via "Proxy Mode Rule Configuration" for collecting the Slave devices data by the Gateway when required. Once the network connection to remote SCADA was lost unexpectedly, the Data Logging Proxy function will be triggered and begin to do the data polling tasks by those pre-defined rules running in background.

➤ Scenario for Sniffer Mode Data Logging

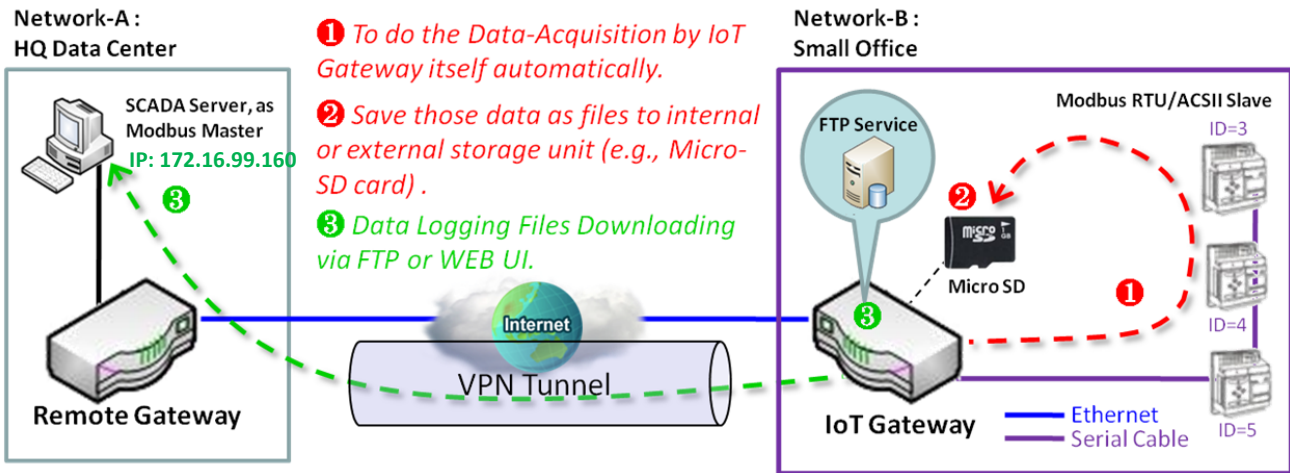

As Illustrated in the diagram, the Modbus gateway will store the following Modbus activities into a log file.

- The Modbus request sent from Remote Modbus TCP Master.
- The response (data) that sent out from the polled Slave device (ID=3)

➤ Scenario for Off-Line Proxy Mode Data Logging

4G IIoT RTU

As illustrated, when the connection to a remote Modbus Master broken, the Modbus Gateway will activate the data logging proxy function and execute the pre-defined data acquisition task by itself.

- The Modbus request issued by the Modbus Gateway (Data Logging Proxy).
- The response (data) that sent out from the polled Slave device (ID=3)

Repeat above data acquisition and data logging activities on every 5 sec interval until the connection recovered.

4G IIoT RTU

4.2.1 Data Logging Configuration

Data Logging is commonly used in monitoring systems to collect and analyze the field data. With proper configuration, the Gateway will record Modbus messages according to the specified rule list.

Go to **Field Communication > Data Logging > Configuration** tab.

Enable Data Logging

Item	Setting
Data Logging	<input type="checkbox"/> Enable
Storage Device	External ▾

Configuration Item	Value setting	Description
Data Logging	The box is unchecked by default.	Check the Enable box to activate to data logging function.
Storage Device	External is set by default	Choose the sotrage device to store the log files. It can be External or Internal , depends on the product specification.
Save	NA	Click the Save button to save the settings.

Note:

1. If there is no available storage device, the Enable checkbox will be grayed, and you can't enable it for the data logging. That is, if you selected External Storage, plug-in the storage first, and then enable the function and also make the required configuration.
2. Make sure the Modbus Operation Mode is selected and enabled, or there will be no Modbus transactions to be logged. Please refer to **Field Communication > Bus & Protocol > Port Configuration** and **Modbus** tabs.

Create/Edit Modbus Proxy Rules

The Gateway allows you to customize your proxy mode rule list. It supports up to a maximum of 20 rules.

ID	Name	Modbus Slave Type	Slave ID	Function Code	Start Address	Number of Coils/Registers	Polling Rate (ms)	Actions
----	------	-------------------	----------	---------------	---------------	---------------------------	-------------------	---------

When the **Add** button is applied, **Modbus Proxy Rule Configuration** screen will appear.

Item	Setting
▶ Name	<input style="width: 100%;" type="text"/>
▶ Modbus Slave Type	IP Address:Port ▼ <input style="width: 100px;" type="text"/> : <input style="width: 50px;" type="text"/>
▶ Slave ID	<input style="width: 50px;" type="text"/> (1~247) - <input style="width: 50px;" type="text"/> (1~247)
▶ Function Code	Read Coils (0x01) ▼
▶ Start Address	<input style="width: 50px;" type="text"/> (0~65535)
▶ Number of Coils/Registers	<input style="width: 50px;" type="text"/> (1~125)
▶ Polling Rate (ms)	<input style="width: 50px;" type="text" value="1000"/> (500~99999)

Modbus Proxy Rule Configuration		
Item	Value setting	Description
Name	A Must filled setting.	Specify a name as the identifier of the Modbus proxy rule. Value Range: 1 ~ 32 characters.
Modbus Slave Type	IP Address :Port is selected by default.	Specify the Modbus Slave devices to apply with the Modbus proxy rule. It can be IP Address:Port for Modbus TCP slaves or Local Serial Port for local attached Modbus RTU/ASCII slaves. Value Range: 1 ~ 65535 for port number
Slave ID	1. A Must filled setting. 2. Range 1 to 247	Specify the ID range for the slave device(s) to apply with the Modbus proxy rule. Value Range: 1 ~ 247.
Function Code	Read Coils (0x01) is selected by default.	Specify a certain read function for the Data Logging Proxy to issue and record the responses from device(s).
Start Address	1. A Must filled setting. 2. Range 0 to 65535	Specify the Start Address of registers to apply with the specified function code. Value Range: 0 ~ 65535.
Number of Coils/Registers	1. A Must filled setting. 2. Range 1 to 125	Specify the number of coils/registers to apply with the specified function code. Value Range: 1 ~ 125. Note: Start Address plus Number must be smaller than 65536.
Polling Rate (ms)	1. A Must filled setting. 2. 1000 ms is set by default	Enter the poll time in milliseconds to apply the Proxy Mode Rule. Once the proxy mode is activated, the Modbus Gateway will issue pre-defined Modbus message on each Poll Time interval accordingly. Value Range: 500 ~ 99999.
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the changes.

4G IIoT RTU

4.2.2 Scheme Setup

There are five data logging schemes to meet different management requirements. They are the Sniffer Mode, Offline Proxy Mode, Full-Time Proxy Mode, and the mixed modes for sniffer and proxy combinations. User has to configure the required data logging rules with selected scheme in this Scheme Setup page.

Go to **Field Communication > Data Logging > Scheme Setup** tab.

Create/Edit Data Logging Rules

ID	Name	Mode	Master Type	Master Query Timeout (sec)	Proxy Rules	Enable	Actions
----	------	------	-------------	----------------------------	-------------	--------	---------

When the **Add** button is applied, **Scheme Configuration** screen will appear.

Item	Setting
Name	<input type="text"/>
Mode	Sniffer
Master Type	IP Address <input type="text"/>
Enable	<input type="checkbox"/>

Item	Value setting	Description
Name	A Must filled setting.	Specify a name as the identifier of the data logging rule. Value Range: 1 ~ 16 characters.
Mode	Sniffer is selected by default.	Select an expected data logging scheme for the data logging rule. There are five available schemes : Sniffer : The Modbus gateway will record all the Modbus transactions between the Master and Slave devices. Off-Line Proxy : When the connection between the Modbus gateway and Master is lost, the pre-defined proxy rule will be triggered and the Modbus gateway will issue specified function code to collect and record the data / status from the slave devices Full-Time Proxy : The pre-defined proxy rule will be triggered all the time and the Modbus gateway will issue specified function code to collect and record the data / status from the slave devices Sniffer & Off-Line Proxy : This is a mixed mode for both Sniffer and Off-Line Proxy modes. Sniffer & Full-Time Proxy : This is a mixed mode for both Sniffer and Full-Time Proxy modes.

4G IIoT RTU

Master Type	IP Address is selected by default.	Specify the Modbus master device to apply with the data logging rule. It can be IP Address for Modbus TCP master, or Local Serial Port for local attached Modbus RTU/ASCII master.
Master Query Timeout (sec.)	1. An Optional setting. 2. 60 sec is set by default 3. Range 1 to 99999	Specify the timeout value for querying Modbus Master. If no response from the master for the specified timeout setting, selected proxy rule will be triggered and applied with the data logging rule. Note: If Off-Line proxy scheme is selected, the timeout setting will be used to check. Otherwise, it is a don't care value.
Proxy Rules	An Optional setting.	Select the Proxy rule to be applied with the data logging rule. Note: If any proxy scheme is selected, please create the required Proxy rules in advance, and select from the list.
Enable	The box is unchecked by default.	Check the box to activate the data logging rule.
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the changes.

4G IIoT RTU

4.2.3 Log File Management

There are five data logging schemes to meet different management requirements. They are the Sniffer Mode, Off-Line Proxy Mode, Full-Time Proxy Mode, and the mixed modes for sniffer and proxy combinations. User has to configure the required data logging rules with selected scheme in this Scheme Setup page.

Go to **Field Communication > Data Logging > Log File Management** tab.

If user had created data log rules in the **Field Communication > Data Logging > Scheme Setup** tab, there will be a log file list shown in the following Log File list screen. The default Log File management settings will be applied if user didn't change it via the **Edit** button.

Log File List								
ID	Name	File Content Format	Split File by	Auto Upload	Log File Compression	Delete File After Upload	When Storage Full	Actions
1	Sniffer Log	Raw Data	200 KB	Disabled	N/A	N/A	Remove the Oldest	<input type="button" value="Edit"/> <input type="button" value="Download Log"/>

When the **Edit** button is applied, **Log File Configuration** screen will appear.

Log File List Configuration	
Item	Setting
File Content Format	Raw Data
Split File by	Size 200 KB
Auto Upload	<input checked="" type="checkbox"/> Enable --- Option --- <input type="button" value="Add Object"/>
Log File Compression	<input type="checkbox"/> Enable
Delete File After Upload	<input type="checkbox"/> Enable
When Storage Full	Remove the Oldest

Log File Configuration		
Item	Value setting	Description
Name	N/A	The name of corresponding data log rule will be displayed. The default log file name will be named as ' Name_yyyyMMddHHmmSS.csv '.
File Content Format	Raw Data is selected by default	Select the data format for the log files. It can be Raw Data , or Modbus Type .
Split File by	Size and 200 KB are set by default	Specify the split file methodology. It can be by Size , or by Time Interval . User has to dpecify a certain file size or time interval for splitting the data logs into a series of files. Value Range: 1 ~ 99999.
Auto Upload	1. An Optional filled setting 2. The box is unchecked	Check the Enable box to activate the auto upload function for logged files. Once been enabled, user has to specify an external FTP server from the dropdown list for auto uploading the log files to the server. Refer to Object

4G IIoT RTU

	by default.	Definition > External Server > External Server tab, or create the FTP server with the Add Object button.
Log File Compression	1. An Optional filled setting 2. The box is unchecked by default	If Auto Upload is activated, user can further specify whether to compress the log file prior it is uploaded or not. Check the Enable button to activate the Log File Compression function...
Delete File After Upload	1. An Optional filled setting 2. The box is unchecked by default	If Auto Upload is activated, user can further specify whether to delete the transferred log from the gateway storage or not. Check the Enable button to activate the function.
When Storage Full	Remove the Oldest is selected by default	Specify the operation to take when the storage is full. It can be Remove the Oldest log file, or Stop Recording . When Remove the Oldest is selected, the gateway will delete the oldest file once the storage is full, and keep on the data logging activity; When Stop Recording is selected, the gateway will stop the data logging activity once the storage is full.
Save	NA	Click the Save button to save the settings.
Undo	NA	Click the Undo button to cancel the changes.

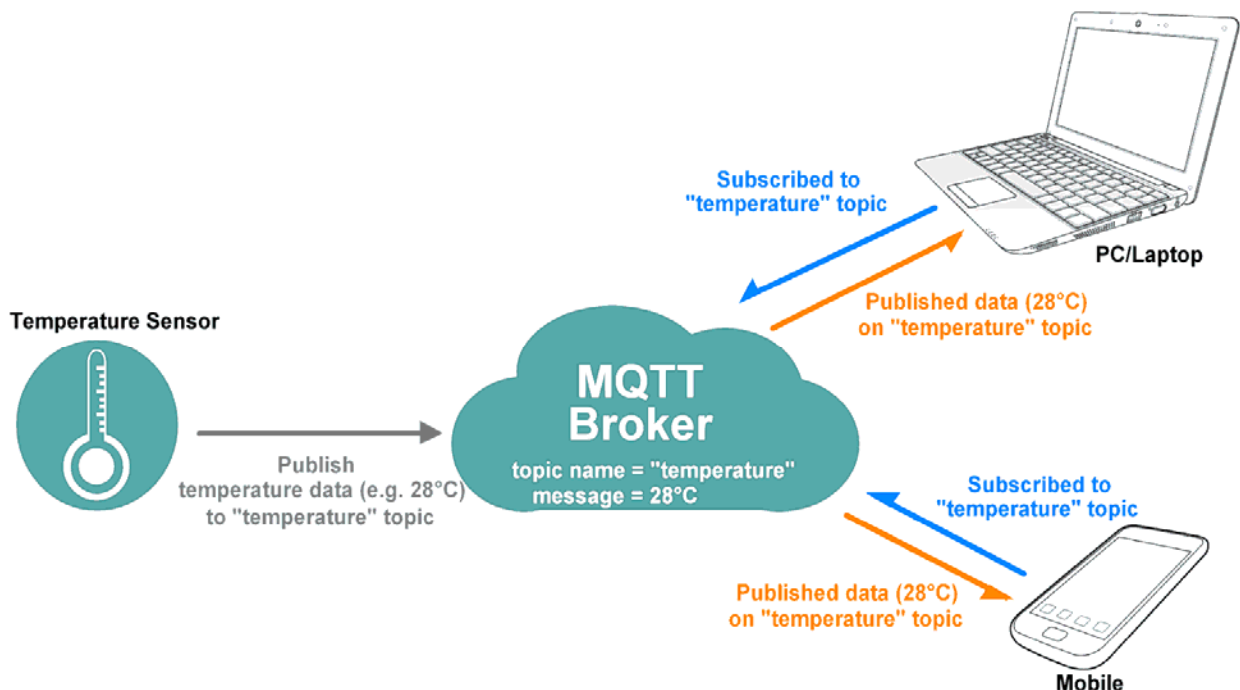

When the **Download Log** button is applied, the web browser will download a file named as 'log.tar' to the managing host computer.

4.3 Data Interchange

4.3.1 MQTT

MQTT (Message Queuing Telemetry Transport) is an ISO standard (ISO/IEC PRF 20922) publish-subscribe based messaging protocol. It works on top of the TCP/IP protocol. MQTT is a simple messaging protocol, designed for constrained devices with low-bandwidth. So, it's the perfect solution for IoT applications. An MQTT system consists of clients communicating with a server, often called a "broker". A client may be either a publisher of information or a subscriber. Each client can connect to the broker.¹⁰

MQTT allows you to send commands to control outputs, read and publish data from sensor nodes, etc... Information is organized in a hierarchy of topics. When a publisher has a new item of data to distribute, it sends a control message with the data to the connected broker. The broker then distributes the information to any clients that have subscribed to that topic. The publisher does not need to have any data on the number or locations of subscribers, and subscribers in turn do not have to be configured with any data about the publishers. Therefore, it makes it really easy to establish a communication among multiple devices.¹¹

If a broker receives a topic for which there are no current subscribers, it will discard the topic unless the publisher indicates that the topic is to be retained. This allows new subscribers to a topic to receive the most current value rather than waiting for the next update from a publisher.

¹⁰ <https://en.wikipedia.org/wiki/MQTT>

¹¹ <https://randomnerdtutorials.com/what-is-mqtt-and-how-it-works/>

4G IIoT RTU

When a publishing client first connects to the broker, it can set up a default message to be sent to subscribers if the broker detects that the publishing client has unexpectedly disconnected from the broker.

Clients only interact with a broker, but a system may contain several broker servers that exchange data based on their current subscribers' topics.

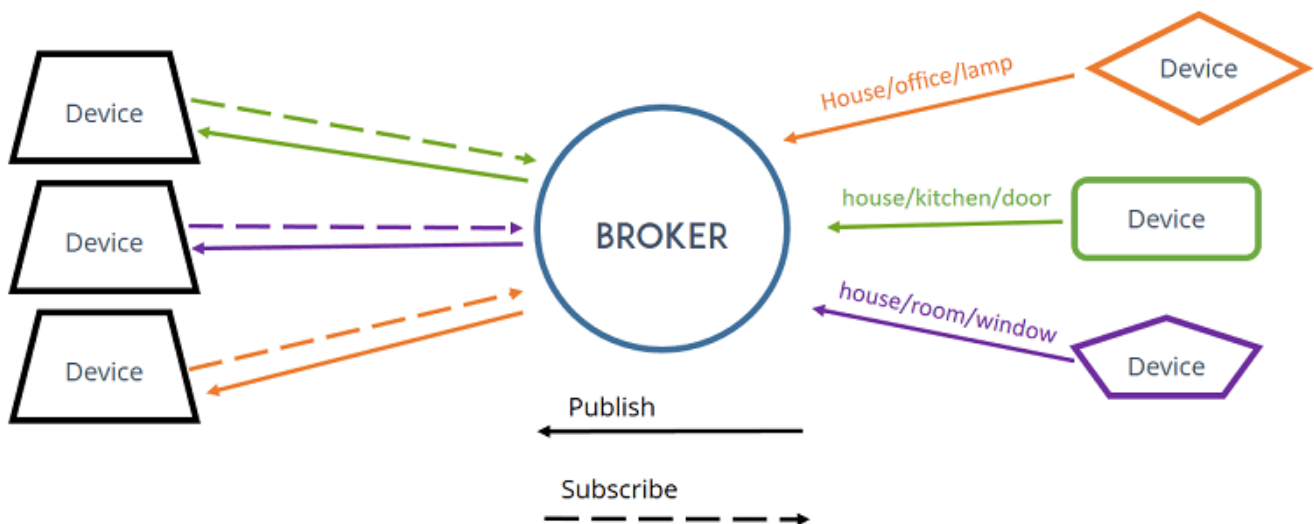

In MQTT there are a few basic concepts that you need to understand:

MQTT - Publish and Subscribe

The first concept is the Publish and subscribe system. In a MQTT publish and subscribe based system, a client device can publish a message on a topic, or it can be subscribed to a particular topic to receive messages.

MQTT - Broker

The broker is primarily responsible for receiving all messages, filtering the messages, decide who is interested in them, and then publishing the message to all subscribed clients.

MQTT - Messages

Messages are the information that you want to exchange among your devices. Whether it is a command or data.

A minimal MQTT control message can be as little as two bytes of data. There are fourteen defined message types used to connect and disconnect a client from a broker, to publish data, to acknowledge receipt of data, and to supervise the connection between client and server.

MQTT – Topics

Topics are the way you register interest for incoming messages or how you specify where you want to publish the message.

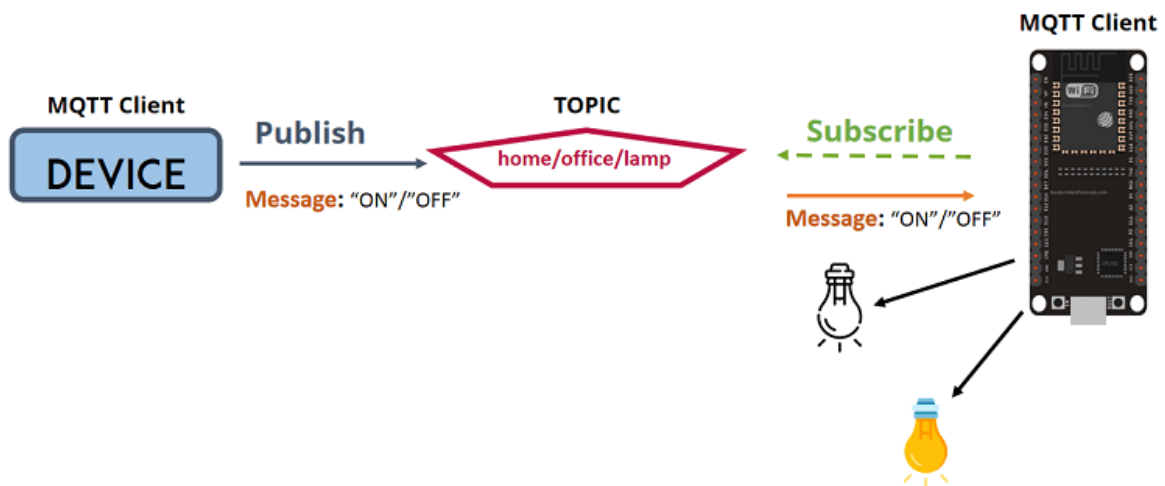

4G IIoT RTU

Topics are represented with strings separated by a forward slash '/'. Each forward slash indicates a topic level. Here's an example on how you would create a topic for a lamp in your home office:

Note: topics are case-sensitive!

If you would like to turn on a lamp in your home office using MQTT, you can imagine the following scenario:

1. You have a device that published "on" and "off" message on the *home/office/lamp* topic.
2. You have a device that controls a lamp. And the device is subscribed to that topic: *home/office/lamp*.
3. So, when a new message is published on that topic, the subscriber received the "on" or "off" message and turns the lamp on or off.

Besides, there are two wildcard characters '+', and '#'. You can use the wildcard characters to subscribe similar topics at the same time easily.

'+' is single level wildcard; A '+' characters represents a single level of hierarchy, and is used between delimiters. For example, you can subscribe the topic *home+/lamp* for all the lamps in a home.

4G IIoT RTU

'#' is the multi-level wildcard; A '#' character represents a complete sub-tree of the hierarchy and must be the last character in a subscription topic string. For example, you can subscribe the topic "home/#" for all the related message in a home.

This product is provided with MQTT client function for message publish / subscription. You can configure it for your IoT application scenario.

Go to **Field Communication > Data Interchange > MQTT** tab.

Play as a MQTT Client

The gateway supports MQTT Client function. It can play as a MQTT client and publish message to MQTT broker, or subscribe interested topic(s) from MQTT Broker(s).

MQTT Client Function	
Item	Setting
MQTT Client	<input type="checkbox"/> Enable

MQTT Broker Configuration		
Item	Value setting	Description
MQTT Client	The box is unchecked by default.	Check the box to activate the MQTT Client function. With the MQTT Client enabled, the gateway play as a MQTT client and publish message to MQTT broker, or subscribe interested topic(s) from MQTT Broker(s)
Save	N/A	Click the Save button to save the settings.

Create/Edit MQTT Client List

MQTT Client List							
ID	Connection Name	Address	Authentication	Security	Port	Enable	Action
1	Broker01	1.2.3.4	<input type="checkbox"/>	None	1883	<input checked="" type="checkbox"/>	<input type="button" value="Subscriptions Received List"/> <input type="button" value="Edit"/> <input type="checkbox"/> Select

When the **Add** button is applied, a sequence of configuration screens will appear. They are **MQTT Client Configuration**, **MQTT Message Configuration**, **Publish Message List**, and **Subscribe Message List**.

Besides, there is a "Subscriptions Received List" button for you to access the subscribed & received message list. When the "Subscriptions Received List" button is applied, a message list will appear, and you can browse it page by page, download the messages to a file, or delete the messages.

4G IIoT RTU

Define MQTT Client Configuration

MQTT Client Configuration	
Item	Setting
▶ Connection Name	<input type="text"/>
▶ Address	<input type="text"/>
▶ Port	<input type="text" value="1883"/> (1~65535)
▶ Authentication	<input type="checkbox"/>
▶ Security	None ▼
▶ Client ID	<input type="text" value="00501869E631"/>
▶ Keep Alive	<input type="text" value="60"/> (5~86400 sec)
▶ Enable	<input type="checkbox"/>

MQTT Client Configuration		
Item	Value setting	Description
Connection Name	The box is unchecked by default.	Specify a name as the identifier of the MQTT Client. It can be identified with the Broker Name, or interested message (topic) Value Range: 1 ~ 64 characters.
Address	1. A Must-filled setting. 2. Blank by default	Specify the host name or IP address of the MQTT broker that the client is going to publish message to it, or subscribe messages from it.
Port	1. An Optional setting. 2. 1883 is set by default	Specify a port as the port for MQTT connection. Value Range: 1 ~ 65535.
Security	1. An Optional setting. 2. None is set by default	Select the security scheme for the MQTT connection. None: no encryption is involved for the MQTT connection. SSL/TLS: SSL/TLS encryption is applied for security. You have to further specify required certificate files. Note: If SSL/TLS is selected, the listen port will be changed to 8883 accordingly by default.
Certificate	1. An Optional setting. 2. None is set by default	Select CA File / CERT File / Key File from the dropdown lists. If you don't have available items in the dropdown list, you have to define or create it first. Please refer to Object Definition > Certificate > Trusted Certificate . CA File could be defined in Trusted Certificate List. CERT File could be defined in Trusted Client Certificate List. KEY File could be defined in Trusted Client Key List.
Client ID	1. A Must-filled setting. 2. ID with device MAC is set by default	Specify an unique ID for the MQTT client. By default the MAC address is used as the ID string.
Authentication	1. An Optional setting. 2. The box is unchecked by default.	Check the box if user (account) authentication is required for subscribing the MQTT messages. With the box checked, you have to further specify Username and Password for the connection.
Username	A Must filled setting.	Specify a name as the identifier of the MQTT client. Value Range: 1 ~ 32 characters.
Password	A Must filled setting.	Specify a password for the user account.

4G IIoT RTU

		Value Range: 1 ~ 32 characters.
Keep Alive	1. An Optional setting. 2. 60 sec is set by default.	Specify a keep alive interval to keep the connection alive while the connection is idle. Value Range: 5 ~ 86400 sec.
Enable	The box is unchecked by default.	Check the box to activate this MQTT Client configuration
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the changes.
Back	N/A	Click the Back button to go back to previous configuration screen.

Define MQTT Message

You can define the Last Will Message, and optional Topic Prefix for publishing / subscribing MQTT messages.

MQTT Message Configuration	
Item	Setting
▶ Last Will	<input checked="" type="checkbox"/> Enable
▶ Topic	<input type="text"/>
▶ Message	<input type="text"/>
▶ QoS	<input checked="" type="radio"/> 0 (At most once) <input type="radio"/> 1 (At least once) <input type="radio"/> 2 (Exactly once)
▶ Topic prefix (Optional)	<input type="text"/>

MQTT Message Configuration		
Item	Value setting	Description
Enable	The box is unchecked by default.	Check the box to activate this Last Will message configuration If the box is checked, you have to further specify Topic, Message, and QoS settings. When the MQTT broker detected that the MQTT client is disconnected, it will send the Last Will message to the interested MQTT subscribers.
Topic	1. A Must-filled setting. 2. Blank by default	Specify the topic for the Last Will message. Value Range: 1 ~ 64 characters, including the topic level separator '/', but excluding the wildcards '+' and '#'.
Message	1. A Must-filled setting. 2. Blank by default	Specify the message content for the Last Will message. Value Range: 1 ~ 256 characters.
QoS	1. An Optional setting. 2. 0 (At most once) is set by default	Select the QoS type for the Last Will message. 0 (At most once): the message will be published only once, and the broker and subscribed client(s) take no additional steps to acknowledge the delivery, no matter it is received or not.

4G IIoT RTU

		<p>1 (At least once): the message will be published at least once until acknowledgement is received from the broker or subscribed client(s).</p> <p>2 (Exactly once): the message will be published to subscriber(s) once in a two-level handshake to ensure only one copy of the message is received.</p>
Topic prefix (Optional)	<p>1. An Optional-filled setting.</p> <p>2. Blank by default</p>	<p>Specify the topic prefix for MQTT message.</p> <p>Value Range: 1 ~ 64 characters.</p>
Save	N/A	Click the Save button to save the settings.
Undo	N/A	Click the Undo button to cancel the changes.
Back	N/A	Click the Back button to go back to previous configuration screen.

Publish Message List

Publish Message List Add Delete				
ID	Topic	QoS	Enable	

Up to 64 published messages will be shown in the message list. When the **Add** button is applied, **Publish Message Configuration** screen will appear.

Chapter 5 Security

5.1 VPN

A virtual private network (VPN) extends a private network across a public network, such as the Internet. It enables a computer to send and receive data across shared or public networks as if it were directly connected to the private network, while benefitting from the functionality, security and management policies of the private network. This is done by establishing a virtual point-to-point connection through the use of dedicated connections, encryption, or a combination of the two. The tunnel technology supports data confidentiality, data origin authentication and data integrity of network information by utilizing encapsulation protocols, encryption algorithms, and hashing algorithms.

The product series supports different tunneling technologies to establish secure tunnels between multiple sites for data transferring, such as IPSec, OpenVPN, L2TP (over IPSec), PPTP and GRE. Besides, some advanced functions, like Full Tunnel, Tunnel Failover, Tunnel Load Balance, NetBIOS over IPSec, NAT Traversal and Dynamic VPN, are also supported.

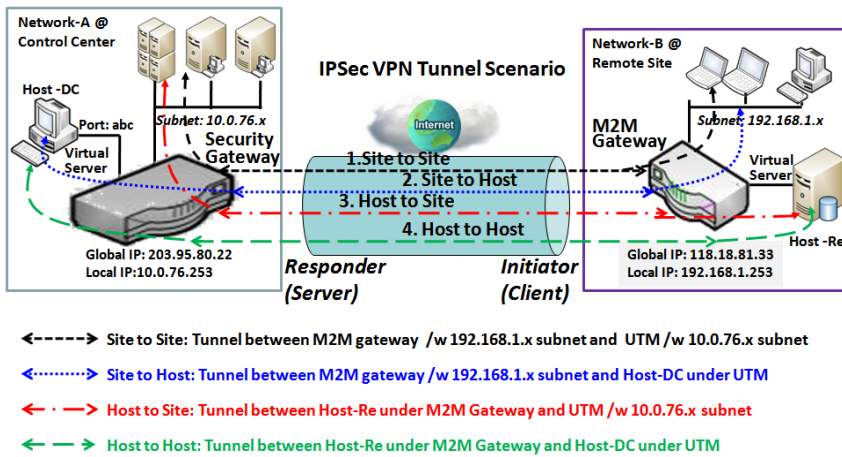

4G IIoT RTU

5.1.1 IPSec

Internet Protocol Security (IPSec) is a protocol suite for securing Internet Protocol (IP) communications by authenticating and encrypting each IP packet of a communication session. IPSec includes protocols for establishing mutual authentication between agents at the beginning of the session and negotiation of cryptographic keys to be used during the session.

An IPSec VPN tunnel is established between IPSec client and server. Sometimes, we call the IPSec VPN client as the initiator and the IPSec VPN server as the responder. This gateway can be configured as different roles and establish number of tunnels with various remote devices. Before going to setup the VPN connections, you may need to decide the scenario type for the tunneling.

IPSec Tunnel Scenarios

To build IPSec tunnel, you need to fill in remote gateway global IP, and optional subnet if the hosts behind IPSec peer can access to remote site or hosts. Under such configuration, there are four scenarios:

Site to Site: You need to setup remote gateway IP and subnet of both gateways. After the IPSec tunnel established, hosts behind both gateways can communication each other through the tunnel.

Site to Host: Site to Host is suitable for tunneling between clients in a subnet and an application server (host). As in the diagram, the clients behind the M2M gateway can access to the host "Host-DC" located in the control center through Site to Host VPN tunnel.

Host to Site: On the contrast, for a single host (or mobile user to) to access the resources located in an intranet, the Host to Site scenario can be applied.

Host to Host: Host to Host is a special configuration for building a VPN tunnel between two single hosts.

4G IIoT RTU

IPSec Setting

Go to **Security > VPN > IPSec** tab.

The IPSec Setting allows user to create and configure IPSec tunnels.

Enable IPSec

Configuration	
Item	Setting
▶ IPSec	<input type="checkbox"/> Enable
▶ Max. Concurrent IPSec Tunnels	3

Configuration Window		
Item	Value setting	Description
IPSec	Unchecked by default	Click the Enable box to enable IPSec function.
Max. Concurrent IPSec Tunnels	Depends on Product specification.	The specified value will limit the maximum number of simultaneous IPSec tunnel connection. The default value can be different for the purchased model.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

Create/Edit IPSec tunnel

Ensure that the IPSec enable box is checked to enable before further configuring the IPSec tunnel settings.

IPSec Tunnel List							
ID	Tunnel Name	Interface	Remote Gateway	Remote Subnet	Status	Enable	Actions

When **Add/Edit** button is applied, a series of configuration screens will appear. They are Tunnel Configuration, Local & Remote Configuration, Authentication, IKE Phase, IKE Proposal Definition, IPSec Phase, and IPSec Proposal Definition. You have to configure the tunnel details for both local and remote VPN devices.

4G IIoT RTU

Tunnel Configuration	
Item	Setting
Tunnel	<input type="checkbox"/> Enable
Tunnel Name	IPSec #1
Interface	WAN-1 ▼
Tunnel Scenario	Site-to-Site(Tunnel mode) ▼
Tunnel TCP MSS	Auto ▼ 0 (64~1500 Bytes)
ICMP Keep alive	<input type="checkbox"/> Enable Max. fail times 3 Interval 30 (secs.) Source Addr. Destination Addr.
Encapsulation Protocol	ESP ▼
IKE Version	v1 ▼

Tunnel Configuration Window		
Item	Value setting	Description
Tunnel	Unchecked by default	Check the Enable box to activate the IPSec tunnel
Tunnel Name	1. A Must fill setting 2. String format can be any text	Enter a tunnel name. Enter a name that is easy for you to identify. Value Range: 1 ~ 19 characters.
Interface	1. A Must fill setting 2. WAN 1 is selected by default	Select the interface on which IPSec tunnel is to be established. It can be the available WAN and LAN interfaces.
Tunnel Scenario	1. A Must fill setting 2. Site to site is selected by default	Select an IPSec tunneling scenario from the dropdown box for your application. Select Site-to-Site , Site-to-Host , Host-to-Site , or Host-to-Host . If LAN interface is selected, only Host-to-Host scenario is available. With Site-to-Site or Site-to-Host or Host-to-Site , IPSec operates in tunnel mode. The difference among them is the number of subnets. With Host-to-Host , IPSec operates in transport mode.
Tunnel TCP MSS	1. An optional setting 2. Auto is set by default	Select from the dropdown box to define the size of Tunnel TCP MSS. Select Auto , and all devices will adjust this parameter automatically. Select Manual , and specify an expected value for Tunnel TCP MSS. Value Range: 64 ~ 1500 bytes.
ICMP Keep Alive	1. An optional setting 2. Unchecked by default	Check the Enable box to activate the ICMP keep alive function for the tunnel. If the keep alive function is enabled, you have to define the number of fail trials, check interval, and source/destination IP address for the ICMP packets. Value Range: 1~999 for fail trials and time interval.
Encapsulation Protocol	1. A Must fill setting 2. ESP is selected by default	Select the Encapsulation Protocol from the dropdown box for this IPSec tunnel. Available encapsulations are ESP and AH .
IKE Version	1. A Must fill setting 2. v1 is selected by default	Specify the IKE version for this IPSec tunnel. Select v1 or v2 .

-------------	-----	---

4G IIoT RTU

5.1.2 OpenVPN

OpenVPN is an application that implements virtual private network (VPN) techniques for creating secure point-to-point or site-to-site connections in routed or bridged configurations and remote access facilities. It uses a custom security protocol that utilizes SSL/TLS for key exchange. It is capable of traversing network address translators (NATs) and firewalls.

OpenVPN allows peers to authenticate each other using a Static Key (pre-shared key) or certificates. When used in a multi-client-server configuration, it allows the server to release an authentication certificate for every client, using signature and certificate authority. It uses the OpenSSL encryption library extensively, as well as the SSLv3/TLSv1 protocol, and contains many security and control features.

OpenVPN Tunneling is a Client and Server based tunneling technology. The OpenVPN Server must have a Static IP or a FQDN, and maintain a Client list. The OpenVPN Client may be a mobile user or mobile site with public IP or private IP, and requesting the OpenVPN tunnel connection. The product supports both OpenVPN Server and OpenVPN Client features to meet different application requirements.

There are two OpenVPN connection scenarios. They are the TAP and TUN scenarios. The product can create either a layer-3 based IP tunnel (TUN), or a layer-2 based Ethernet TAP that can carry any type of Ethernet traffic. In addition to configuring the device as a Server or Client, you have to specify which type of OpenVPN connection scenario is to be adopted.

OpenVPN TUN Scenario

1. M2M-IoT Gateway (as OpenVPN TUN Client) connects to peer VPN Gateway/Concentrator (as OpenVPN TUN Server).
2. M2M-IoT Gateway will be assigned 10.8.0.2 IP Address after OpenVPN TUN Connection established. (10.8.0.x is a virtual subnet)
3. Local networked device will get a virtual IP 10.8.0.x if its traffic goes through the OpenVPN TUN connection (when NAT disabled & Redirect Internet Traffic enabled).
4. SCADA Server in Control Center can access remote attached device(s) with the assigned IP Address 10.8.0.2.

solution.

As shown in the diagram, the M2M-IoT Gateway is configured as an OpenVPN TUN Client, and connects to an

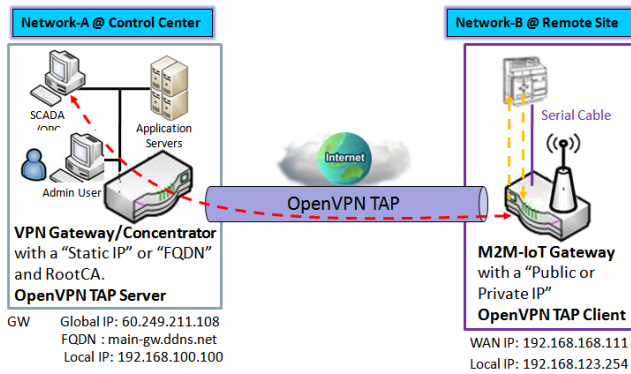

The term "TUN" mode is referred to routing mode and operates with layer 3 packets. In routing mode, the VPN client is given an IP address on a different subnet than the local LAN under the OpenVPN server. This virtual subnet is created for connecting to any remote VPN computers. In routing mode, the OpenVPN server creates a "TUN" interface with its own IP address pool which is different to the local LAN. Remote hosts that dial-in will get an IP address inside the virtual network and will have access only to the server where OpenVPN resides.

If you want to offer remote access to a VPN server from client(s), and inhibit the access to remote LAN resources under VPN server, OpenVPN TUN mode is the simplest

4G IIoT RTU

OpenVPN UN Server. Once the OpenVPN TUN connection is established, the connected TUN client will be assigned a virtual IP (10.8.0.2) which is belong to a virtual subnet that is different to the local subnet in Control Center. With such connection, the local networked devices will get a virtual IP 10.8.0.x if its traffic goes through the OpenVPN TUN connection when Redirect Internet Traffic settings is enabled; Besides, the SCADA Server in Control Center can access remote attached serial device(s) with the virtual IP address (10.8.0.2).

OpenVPN TAP Scenario

1. M2M-IoT Gateway (as OpenVPN TAP Client) connects to peer VPN Gateway/Concentrator (as OpenVPN TAP Server).
2. M2M-IoT Gateway will be assigned **192.168.100.210** IP Address after OpenVPN TAP Connection established. (*same subnet as in Control Center*)
3. SCADA Server in Control Center can access remote attached device(s) with the assigned IP Address 192.168.100.210.

The term "TAP" is referred to bridge mode and operates with layer 2 packets. In bridge mode, the VPN client is given an IP address on the same subnet as the LAN resided under the OpenVPN server. Under such configuration, the OpenVPN client can directly access to the resources in LAN. If you want to offer remote access to the entire remote LAN for VPN client(s), you have to setup OpenVPN in "TAP" bridge mode.

As shown in the diagram, the M2M-IoT Gateway is configured as an OpenVPN TAP Client, and connects to an OpenVPN TAP Server. Once the OpenVPN TAP connection is established, the connected TAP client will be assigned a virtual IP (192.168.100.210) which is the same subnet as

that of local subnet in Control Center. With such connection, the SCADA Server in Control Center can access remote attached device(s) with the virtual IP address (192.168.100.210).

4G IIoT RTU

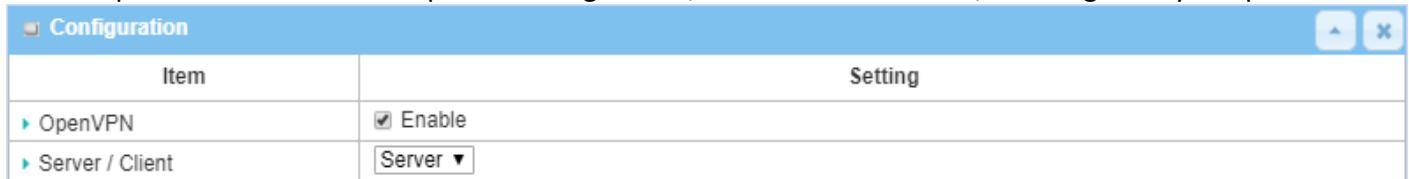

Open VPN Setting

Go to **Security > VPN > OpenVPN** tab.

The OpenVPN setting allows user to create and configure OpenVPN tunnels.

Enable OpenVPN

Enable OpenVPN and select an expected configuration, either server or client, for the gateway to operate.

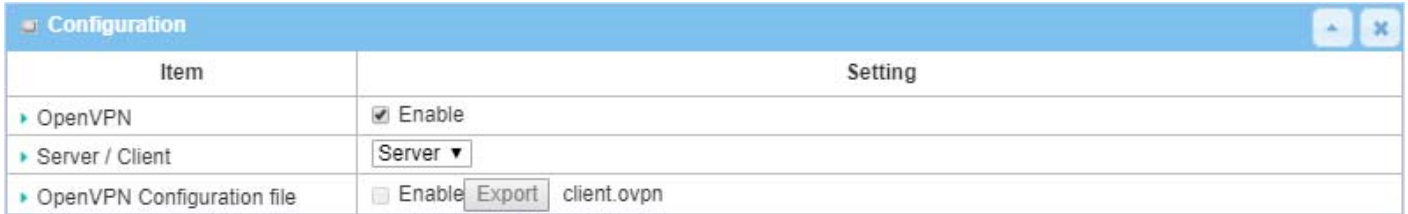

Item	Setting
▶ OpenVPN	<input checked="" type="checkbox"/> Enable
▶ Server / Client	Server ▼

Configuration Item	Value setting	Description
OpenVPN	The box is unchecked by default	Check the Enable box to activate the OpenVPN function.
Server/Client	Server Configuration is selected by default.	When Server is selected, as the name indicated, server configuration will be displayed below for further setup. When Client is selected, you can specify the client settings in another client configuration window.

4G IIoT RTU

As an OpenVPN Server

If **Server** is selected, an OpenVPN Server Configuration screen will appear. **OpenVPN Server Configuration** window can let you enable the OpenVPN server function, specify the virtual IP address of OpenVPN server, when remote OpenVPN clients dial in, and the authentication protocol.

Item	Setting
▶ OpenVPN	<input checked="" type="checkbox"/> Enable
▶ Server / Client	Server ▼
▶ OpenVPN Configuration file	<input type="checkbox"/> Enable <input type="button" value="Export"/> client.ovpn

Item	Value setting	Description
OpenVPN Configuration File	1. An Optional setting. 2. The box is unchecked by default.	Click the Enable box to activate the export feature of OpenVPN Client configuration to a .ovpn file. You have to further click the Export button to get the configuration file.

The OpenVPN Server supports up to 4 TUN / TAP tunnels at the same time.

OpenVPN Client Configuration		
Item	Value setting	Description
OpenVPN Client Name	A Must filled setting	The OpenVPN Client Name will be used to identify the client in the tunnel list. Value Range: 1 ~ 32 characters.
Interface	1. A Must filled setting 2. By default WAN-1 is selected.	Define the physical interface to be used for this OpenVPN Client tunnel.
Protocol	1. A Must filled setting 2. By default TCP is selected.	Define the Protocol for the OpenVPN Client. <ul style="list-style-type: none"> • Select TCP ->The OpenVPN will use TCP protocol, and Port will be set as 443 automatically. • Select UDP -> The OpenVPN will use UDP protocol, and Port will be set as 1194 automatically.
Port	1. A Must filled setting 2. By default 443 is set.	Specify the Port for the OpenVPN Client to use. Value Range: 1 ~ 65535.
Tunnel Scenario	1. A Must filled setting 2. By default TUN is selected.	Specify the type of Tunnel Scenario for the OpenVPN Client to use. It can be TUN for TUN tunnel scenario, or TAP for TAP tunnel scenario.
Remote IP/FQDN	A Must filled setting	Specify the Remote IP/FQDN of the peer OpenVPN Server for this OpenVPN Client tunnel. Fill in the IP address or FQDN.
Remote Subnet	1. An Optional setting. 2. The box is unchecked by default.	Check the Enable box to activate remote subnet function, and specify Remote Subnet of the peer OpenVPN Server for this OpenVPN Client tunnel. Fill in the remote subnet address and remote subnet mask.
Redirect Internet Traffic	1. An Optional setting. 2. The box is unchecked by default.	Check the Enable box to activate the Redirect Internet Traffic function.
NAT	1. An Optional setting.	Check the Enable box to activate the NAT function.

4G IIoT RTU

	2. The box is checked by default.	
Authorization Mode	1. A Must filled setting 2. By default TLS is selected.	Specify the authorization mode for the OpenVPN Server. <ul style="list-style-type: none"> • TLS ->The OpenVPN will use TLS authorization mode, and the following items CA Cert., Client Cert. and Client Key will be displayed. CA Cert. could be selected in Trusted CA Certificate List. Refer to Object Definition > Certificate > Trusted Certificate. Client Cert. could be selected in Local Certificate List. Refer to Object Definition > Certificate > My Certificate. Client Key could be selected in Trusted Client key List. Refer to Object Definition > Certificate > Trusted Certificate. • Static Key ->The OpenVPN will use static key authorization mode, and the following items Local Endpoint IP Address, Remote Endpoint IP Address and Static Key will be displayed.
Local Endpoint IP Address	A Must filled setting	Specify the virtual Local Endpoint IP Address of this OpenVPN gateway. Value Range: The IP format is 10.8.0.x, the range of x is 1~254. Note: Local Endpoint IP Address will be available only when Static Key is chosen in Authorization Mode.
Remote Endpoint IP Address	A Must filled setting	Specify the virtual Remote Endpoint IP Address of the peer OpenVPN gateway. Value Range: The IP format is 10.8.0.x, the range of x is 1~254. Note: Remote Endpoint IP Address will be available only when Static Key is chosen in Authorization Mode.
Static Key	A Must filled setting	Specify the Static Key . Note: Static Key will be available only when Static Key is chosen in Authorization Mode.
Encryption Cipher	By default Blowfish is selected.	Specify the Encryption Cipher . It can be Blowfish/AES-256/AES-192/AES-128/None .
Hash Algorithm	By default SHA-1 is selected.	Specify the Hash Algorithm . It can be SHA-1/MD5/MD4/SHA2-256/SHA2-512/None/Disable .
LZO Compression	By default Adaptive is selected.	Specify the LZO Compression scheme. It can be Adaptive/YES/NO/Default .
Multicast	1. An Optional setting. 2. The box is checked by default.	Check the Enable box to activate the Multicast function. Note: Multicast function is only available for TAP tunnel scenario.
Persis Key	1. An Optional setting. 2. The box is checked by default.	Check the Enable box to activate the Persis Key function.
Persis Tun	1. An Optional setting. 2. The box is checked by default.	Check the Enable box to activate the Persis Tun function.
Advanced Configuration	N/A	Click the Edit button to specify the Advanced Configuration setting for the OpenVPN server. If the button is clicked, Advanced Configuration will be displayed below.
Tunnel	The box is unchecked by default	Check the Enable box to activate this OpenVPN tunnel.

OpenVPN Advanced Client Configuration		
Item	Value setting	Description
TLS Cipher	1. A Must filled setting. 2. TLS-RSA-WITH-AES128-SHA is selected by default	Specify the TLS Cipher from the dropdown list. It can be None / TLS-RSA-WITH-RC4-MD5 / TLS-RSA-WITH-AES128-SHA / TLS-RSA-WITH-AES256-SHA / TLS-DHE-DSS-AES128-SHA / TLS-DHE-DSS-AES256-SHA . Note: TLS Cipher will be available only when TLS is chosen in Authorization Mode.
TLS Auth. Key	1. An Optional setting. 2. String format: any text	Specify the TLS Auth. Key for connecting to an OpenVPN server, if the server required it. Note: TLS Auth. Key will be available only when TLS is chosen in Authorization Mode.
User Name	An Optional setting.	Enter the User account for connecting to an OpenVPN server, if the server required it. Note: User Name will be available only when TLS is chosen in Authorization Mode.
Password	An Optional setting.	Enter the Password for connecting to an OpenVPN server, if the server required it. Note: User Name will be available only when TLS is chosen in Authorization Mode.
Bridge TAP to	By default VLAN 1 is selected	Specify the setting of “ Bridge TAP to ” to bridge the TAP interface to a certain local network interface or VLAN. Note: Bridge TAP to will be available only when TAP is chosen in Tunnel Scenario and NAT is unchecked.
Firewall Protection	The box is unchecked by default.	Check the box to activate the Firewall Protection function. Note: Firewall Protection will be available only when NAT is enabled.

4G IIoT RTU

Client IP Address	By default Dynamic IP is selected	Specify the virtual IP Address for the OpenVPN Client. It can be Dynamic IP/Static IP .
Tunnel MTU	1.A Must filled setting 2.The value is 1500 by default	Specify the value of Tunnel MTU . <i>Value Range: 0 ~ 1500.</i>
Tunnel UDP Fragment	The value is 1500 by default	Specify the value of Tunnel UDP Fragment . <i>Value Range: 0 ~ 1500.</i> Note: Tunnel UDP Fragment will be available only when UDP is chosen in Protocol.
Tunnel UDP MSS-Fix	The box is unchecked by default.	Check the Enable box to activate the Tunnel UDP MSS-Fix function. Note: Tunnel UDP MSS-Fix will be available only when UDP is chosen in Protocol.
nsCerType Verification	The box is unchecked by default.	Check the Enable box to activate the nsCerType Verification function. Note: nsCerType Verification will be available only when TLS is chosen in Authorization Mode.
TLS Renegotiation Time (seconds)	The value is 3600 by default	Specify the time interval of TLS Renegotiation Time . <i>Value Range: -1 ~ 86400.</i>
Connection Retry(seconds)	The value is -1 by default	Specify the time interval of Connection Retry . The default -1 means that it is no need to execute connection retry. <i>Value Range: -1 ~ 86400, and -1 means no retry is required.</i>
DNS	By default Automatically is selected	Specify the setting of DNS . It can be Automatically/Manually .
Additional Configuration	An Optional setting.	Enter optional configuration string here. Up to 256 characters is allowable. <i>Value Range: 0 ~ 256 characters.</i>
Save	N/A	Click Save to save the settings.
Undo	N/A	Click X to cancel the changes and return to last page.

L2TP Client	<input type="checkbox"/> Enable

L2TP Client List & Status								
ID	Tunnel Name	Interface	Virtual IP	Remote IP/FQDN	Remote Subnet	Status	Enable	Actions
<input type="button" value="Add"/> <input type="button" value="Delete"/> <input type="button" value="Refresh"/>								

Layer 2 Tunneling Protocol (L2TP) is a tunneling protocol used to support virtual private networks (VPNs) or as part of the delivery of services by ISPs. It does not provide any encryption or confidentiality by itself. Rather, it relies on an encryption protocol that it passes within the tunnel to provide privacy. This Gateway can only behave as a L2TP client for a L2TP VPN tunnel.

L2TP Client: It can be mobile users or gateways in remote offices with dynamic IP. To setup tunnel, it should get "user name", "password" and server's global IP. In addition, it is required to identify the operation mode for each tunnel as main connection, failover for another tunnel, or load balance tunnel to increase overall bandwidth. It needs to decide "Default Gateway" or "Remote Subnet" for packet flow. Moreover, you can also define what kind of traffics will pass through the L2TP tunnel in the "Default Gateway / Remote Subnet" parameter.

Besides, for the L2TP client peer, a Remote Subnet item is required. It is for the Intranet of L2TP server peer. So, at L2TP client peer, the packets whose destination is in the dedicated subnet will be transferred via the L2TP tunnel. Others will be transferred based on current routing policy of the gateway at L2TP client peer. But, if you entered 0.0.0.0/0 in the Remote Subnet field, it will be treated as a "Default Gateway" setting for the L2TP client peer, all packets, including the Internet accessing of L2TP client peer, will go through the established L2TP tunnel. That means the remote L2TP server peer controls the flow of any packets from the L2TP client peer.

4G IIoT RTU

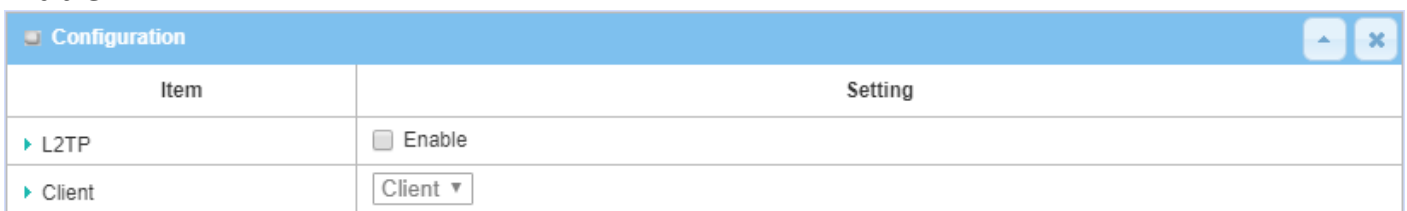

Certainly, those packets come through the L2TP tunnel.

L2TP Setting

Go to **Security > VPN > L2TP** tab.

The L2TP setting allows user to create and configure L2TP tunnels.

Enable L2TP

L2TP Client Configuration		
Item Setting	Value setting	Description
Tunnel Name	A Must filled setting	Enter a tunnel name. Enter a name that is easy for you to identify. Value Range: 1 ~ 32 characters.
Interface	A Must filled setting	Define the selected interface to be the used for this L2TP tunnel (WAN-1 is available only when WAN-1 interface is enabled) The same applies to other WAN interfaces (e.g. WAN-2).
L2TP over IPsec	The box is unchecked by default	When click the Enable box. It will enable L2TP over IPsec and need to fill in the Pre-shared Key (2~31 characters). Furthermore, you can also click the Advanced Settings button to specify required settings for IKE Proposal and IPsec Proposal definitions:

4G IIoT RTU

		<p>Encryption method: It can be DES / 3DES / AES-128 / AES-192 / AES-256.</p> <p>Authentication method: It can be None / MD5 / SHA1 / SHA2-256.</p> <p>DH Group: It can be None / Group1 / Group2 / Group5 / Group14 / Group15 / Group16 / Group17 / Group18.</p>
Remote LNS IP/FQDN	A Must filled setting	Enter the public IP address or the FQDN of the L2TP server.
MTU	1.A Must filled setting 2.The value is 1500 by default	Specify the MTU . Value Range: 0 ~ 1500.
Remote LNS Port	1. A Must filled setting 2. 1701 is set by default	Enter the Remote LNS Port for this L2TP tunnel. Value Range: 1 ~ 65535.
User Name	A Must filled setting	Enter the User Name for this L2TP tunnel to be authenticated when connect to L2TP server. Value Range: 1 ~ 32 characters.
Password	A Must filled setting	Enter the Password for this L2TP tunnel to be authenticated when connect to L2TP server.
Tunneling Password(Optional)	An Optional filled setting	Enter the Tunneling Password for this L2TP tunnel to authenticate.
Remote Subnet	A Must filled setting	Specify the remote subnet for this L2TP tunnel to reach L2TP server. The Remote Subnet format must be IP address/netmask (e.g. 10.0.0.2/24). It is for the Intranet of L2TP VPN server. So, at L2TP client peer, the packets whose destination is in the dedicated subnet will be transferred via the L2TP VPN tunnel. Others will be transferred based on current routing policy of the security gateway at L2TP client peer. If you entered 0.0.0.0/0 in the Remote Subnet field, it will be treated as a default gateway setting for the L2TP client peer, all packets, including the Internet accessing of L2TP Client peer, will go through the established L2TP VPN tunnel. That means the remote L2TP VPN server controls the flow of any packets from the L2TP client peer. Certainly, those packets come through the L2TP VPN tunnel.
Authentication Protocol	1. A Must filled setting 2. Unchecked by default	Specify one ore multiple Authentication Protocol for this L2TP tunnel. Available authentication methods are PAP / CHAP / MS-CHAP / MS-CHAP v2.
MPPE Encryption	1. Unchecked by default 2. an optional setting	Specify whether L2TP server supports MPPE Protocol . Click the Enable box to enable MPPE. Note: when MPPE Encryption is enabled, the Authentication Protocol PAP / CHAP options will not be available.
NAT before Tunneling	1. A Must filled setting 2. Unchecked by default	Specify whether NAT is required or not for this L2TP tunnel.
LCP Echo Type	1. Auto is set by default	Specify the LCP Echo Type for this L2TP tunnel. It can be Auto, User-defined, or Disable. Auto: the system sets the Interval and Max. Failure Time. User-defined: enter the Interval and Max. Failure Time. The default value for Interval is 30 seconds, and Maximum Failure Times is 6 Times.

4G IIoT RTU

		Disable: disable the LCP Echo. Value Range: 1 ~ 99999 for Interval Time, 1~999 for Failure Time.
Service Port	A Must filled setting	Specify the Service Port for this L2TP tunnel to use. It can be Auto, (1701) for Cisco , or User-defined . Auto: The system determines the service port. 1701 (for Cisco): The system use port 1701 for connecting with CISCO L2TP Server. User-defined: Enter the service port. The default value is 0. Value Range: 0 ~ 65535.
Tunnel	Unchecked by default	Check the Enable box to enable this L2TP tunnel.
Save	N/A	Click Save button to save the settings.

<div style="display: flex; justify-content: flex-end; gap: 10px;"> Add Delete Refresh </div>								

Point-to-Point Tunneling Protocol (PPTP) is a method for implementing virtual private networks. PPTP uses a control channel over TCP and a GRE tunnel operating to encapsulate PPP packets. It is a client-server based technology. There are various levels of authentication and encryption for PPTP tunneling, usually natively as standard features of the Windows PPTP stack. The security gateway can only play "PPTP Client" role for a PPTP VPN tunnel. PPTP tunnel process is nearly the same as L2TP.

PPTP Client: It can be mobile users or gateways in remote offices with dynamic IP. To setup tunnel, it should get "user name", "password" and server's global IP. In addition, it is required to identify the operation mode for each tunnel as main connection, failover for another tunnel, or load balance tunnel to increase overall bandwidth. It needs to decide "Default Gateway" or "Remote Subnet" for packet flow. Moreover, you can also define what kind of traffics will pass through the PPTP tunnel in the "Default Gateway / Remote Subnet" parameter.

Besides, for the PPTP client peer, a Remote Subnet item is required. It is for the Intranet of PPTP server peer. So, at PPTP client peer, the packets whose destination is in the dedicated subnet will be transferred via the PPTP tunnel. Others will be transferred based on current routing policy of the gateway at PPTP client peer. But, if you entered 0.0.0.0/0 in the Remote Subnet field, it will be treated as a "Default Gateway" setting for the PPTP client peer, all packets, including the Internet accessing of PPTP client peer, will go through the established PPTP tunnel. That means the remote PPTP server peer controls the flow of

Item	Value setting	Description
Tunnel Name	A Must fill setting	Enter a tunnel name. Enter a name that is easy for you to identify. Value Range: 1 ~ 32 characters.
Interface	1. A Must fill setting 2. WAN1 is selected by default	Define the selected interface to be the used for this PPTP tunnel (WAN-1 is available only when WAN-1 interface is enabled) The same applies to other WAN interfaces (e.g. WAN-2).
Remote IP/FQDN	1. A Must fill setting. 2. Format can be a ipv4 address or FQDN	Enter the public IP address or the FQDN of the PPTP server.
MTU	1.A Must filled setting 2.The value is 1500 by default	Specify the MTU . Value Range: 0 ~ 1500.
User Name	A Must fill setting	Enter the User Name for this PPTP tunnel to be authenticated when connect to PPTP server. Value Range: 1 ~ 32 characters.
Password	A Must fill setting	Enter the Password for this PPTP tunnel to be authenticated when connect to PPTP server.
Remote Subnet	A Must fill setting	Specify the remote subnet for this PPTP tunnel to reach PPTP server. The Remote Subnet format must be IP address/netmask (e.g. 10.0.0.2/24). It is for the Intranet of PPTP VPN server. So, at PPTP client peer, the packets whose destination is in the dedicated subnet will be transferred via the PPTP

4G IIoT RTU

		<p>VPN tunnel. Others will be transferred based on current routing policy of the security gateway at PPTP client peer.</p> <p>If you entered 0.0.0.0/0 in the Remote Subnet field, it will be treated as a default gateway setting for the PPTP client peer, all packets, including the Internet accessing of PPTP Client peer, will go through the established PPTP VPN tunnel. That means the remote PPTP VPN server controls the flow of any packets from the PPTP client peer. Certainly, those packets come through the PPTP VPN tunnel.</p>
Authentication Protocol	<ol style="list-style-type: none"> 1. A Must fill setting 2. Unchecked by default 	<p>Specify one or multiple Authentication Protocol for this PPTP tunnel. Available authentication methods are PAP / CHAP / MS-CHAP / MS-CHAP v2.</p>
MPPE Encryption	<ol style="list-style-type: none"> 1. Unchecked by default 2. an optional setting 	<p>Specify whether PPTP server supports MPPE Protocol. Click the Enable box to enable MPPE.</p> <p>Note: when MPPE Encryption is enabled, the Authentication Protocol PAP / CHAP options will not be available.</p>
NAT before Tunneling	<ol style="list-style-type: none"> 1. A Must filled setting 2. Unchecked by default 	<p>Specify whether NAT is required or not for this PPTP tunnel.</p>
LCP Echo Type	<p>Auto is set by default</p>	<p>Specify the LCP Echo Type for this PPTP tunnel. It can be Auto, User-defined, or Disable.</p> <p>Auto: the system sets the Interval and Max. Failure Time.</p> <p>User-defined: enter the Interval and Max. Failure Time. The default value for Interval is 30 seconds, and Maximum Failure Times is 6 Times.</p> <p>Disable: disable the LCP Echo.</p> <p>Value Range: 1 ~ 99999 for Interval Time, 1~999 for Failure Time.</p>
Tunnel	<p>Unchecked by default</p>	<p>Check the Enable box to enable this PPTP tunnel.</p>
Save	<p>N/A</p>	<p>Click Save button to save the settings.</p>
Undo	<p>N/A</p>	<p>Click X button to cancel the settings and back to last page.</p>

4G IIoT RTU

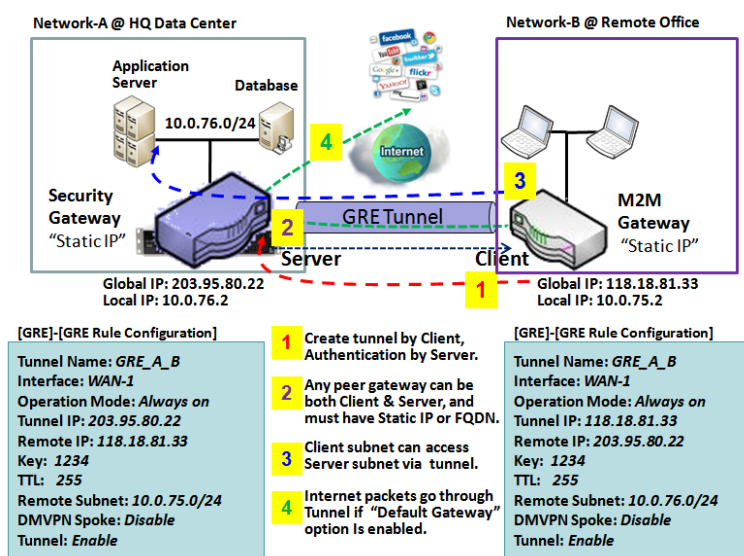

5.1.5 GRE

Generic Routing Encapsulation (GRE) is a tunneling protocol developed by Cisco Systems that encapsulates a wide variety of network layer protocols inside virtual point-to-point links over an Internet Protocol internetwork.

Deploy a M2M gateway for remote site and establish a virtual private network with control center by using GRE tunneling. So, all client hosts behind M2M gateway can make data communication with server hosts behind control center gateway.

GRE Tunneling is similar to IPSec Tunneling, client requesting the tunnel establishment with the server. Both the client and the server must have a Static IP or a FQDN. Any peer gateway can be worked as either a client or a server, even using the same set of configuration rule.

GRE Tunnel Scenario

To setup a GRE tunnel, each peer needs to setup its global IP as tunnel IP and fill in the other's global IP as remote IP.

Besides, each peer must further specify the Remote Subnet item. It is for the Intranet of GRE server peer. So, at GRE client peer, the packets whose destination is in the dedicated subnet will be transferred via the GRE tunnel. Others will be transferred based on current routing policy of the gateway at GRE client peer. But, if you entered 0.0.0.0/0 in the Remote Subnet field, it will be treated as a "Default Gateway" setting for the GRE client peer, all packets, including the Internet accessing of GRE client peer, will go through the established GRE

tunnel. That means the remote GRE server peer controls the flow of any packets from the GRE client peer. Certainly, those packets come through the GRE tunnel.

If the GRE server supports DMVPN Hub function, like Cisco router as the VPN concentrator, the GRE client can active the DMVPN spoke function here since it is implemented by GRE over IPSec tunneling.

4G IIoT RTU

GRE Setting

Go to **Security > VPN > GRE** tab.

The GRE setting allows user to create and configure GRE tunnels.

Enable GRE

Configuration	
Item	Setting
GRE Tunnel	<input type="checkbox"/> Enable
Max. Concurrent GRE Tunnels	32

Enable GRE Window		
Item	Value setting	Description
GRE Tunnel	Unchecked by default	Click the Enable box to enable GRE function.
Max. Concurrent GRE Tunnels	Depends on Product specification.	The specified value will limit the maximum number of simultaneous GRE tunnel connection. The default value can be different for the purchased model.
Save	N/A	Click Save button to save the settings

4G IIoT RTU

5.2 Firewall

The firewall functions include Packet Filter, URL Blocking, Content Filter, MAC Control, Application Filter, IPS and some firewall options. The supported function can be different for the purchased gateway.

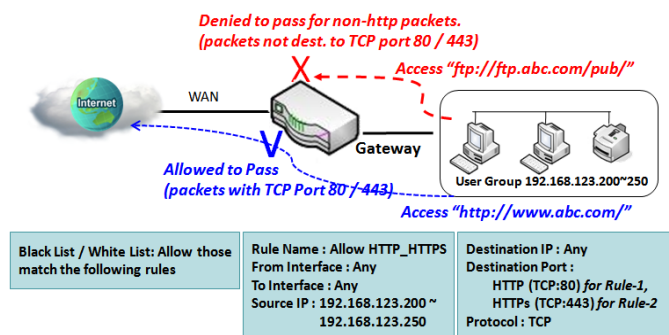

5.2.1 Packet Filter

Configuration												
Item	Setting											
▶ Packet Filters	<input checked="" type="checkbox"/> Enable											
▶ Black List / White List	Deny those match the following rules. ▾											
▶ Log Alert	<input type="checkbox"/> Log Alert											
Packet Filter List												
ID	Rule Name	From Interface	To Interface	Source IP	Destination IP	Source MAC	Protocol	Source Port	Destination Port	Time Schedule	Enable	Actions

4G IIoT RTU

"Packet Filter" function can let you define some filtering rules for incoming and outgoing packets. So the gateway can control what packets are allowed or blocked to pass through it. A packet filter rule should indicate from and to which interface the packet enters and leaves the gateway, the source and destination IP addresses, and destination service port type and port number. In addition, the time schedule to which the rule will be active.

Packet Filter with White List Scenario

As shown in the diagram, specify "Packet Filter Rule List" as white list (Allow those match the following rules) and define the rules. Rule-1 is to allow HTTP packets to pass, and Rule-2 is to allow HTTPS packets to pass.

Under such configuration, the gateway will allow only HTTP and HTTPS packets, issued from the IP range 192.168.123.200 to 250, which are targeted to TCP port 80 or 443 to pass the WAN interface.

Packet Filter Setting

Go to **Security > Firewall > Packet Filter** Tab.

The packet filter setting allows user to create and customize packet filter policies to allow or reject specific inbound/outbound packets through the router based on their office setting.

Enable Packet Filter

Item	Setting
Packet Filters	<input type="checkbox"/> Enable
Black List / White List	Deny those match the following rules. ▾
Log Alert	<input type="checkbox"/> Log Alert

Item Name	Value setting	Description
Packet Filter	The box is unchecked by default	Check the Enable box to activate Packet Filter function

4G IIoT RTU

Black List / White List	Deny those match the following rules is set by default	When Deny those match the following rules is selected, as the name suggest, packets specified in the rules will be blocked –black listed. In contrast, with Allow those match the following rules , you can specifically white list the packets to pass and the rest will be blocked.
Log Alert	The box is unchecked by default	Check the Enable box to activate Event Log.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

Create/Edit Packet Filter Rules

The gateway allows you to customize your packet filtering rules. It supports up to a maximum of 20 filter rule sets.

When **Add** button is applied, **Packet Filter Rule Configuration** screen will appear.

Packet Filter Rule Configuration
⏪ ⏩ ✕

Item	Setting

MAC Control Rule List

↑ ×

ID	Rule Name	MAC Address	Time Schedule Rule	Enable	Actions

"MAC Control" function allows you to assign the accessibility to the gateway for different users based on device's MAC address. When the administrator wants to reject the traffics from some client hosts with specific MAC addresses, he can use the "MAC Control" function to reject with the black list configuration.

MAC Control with Black List Scenario

As shown in the diagram, enable the MAC control function and specify the "MAC Control Rule List" is a black list, and configure one MAC control rule for the gateway to deny the connection request from the "JP NB" with its own MAC address 20:6A:6A:6A:6A:6B.

System will block the connecting from the "JP NB" to the gateway but allow others.

4G IIoT RTU

MAC Control Setting

Go to **Security > Firewall > MAC Control** Tab.

The MAC control setting allows user to create and customize MAC address policies to allow or reject packets with specific source MAC address.

Enable MAC Control

Item	Setting
▶ MAC Control	<input type="checkbox"/> Enable

4G IIoT RTU

5.2.6 IPS

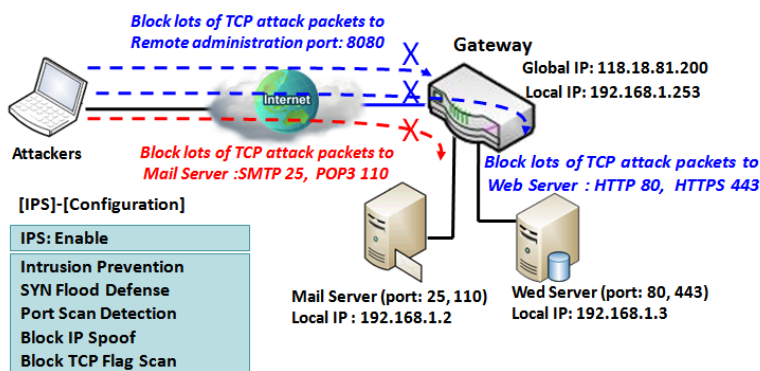

Configuration	
Item	Setting
▶ IPS	<input type="checkbox"/> Enable
▶ Log Alert	<input type="checkbox"/> Enable

Intrusion Prevention	
Item	Setting
▶ SYN Flood Defense	<input type="checkbox"/> Enable <input type="text" value="300"/> Packets/second (10~10000)
▶ UDP Flood Defense	<input type="checkbox"/> Enable <input type="text" value="300"/> Packets/second (10~10000)
▶ ICMP Flood Defense	<input type="checkbox"/> Enable <input type="text" value="300"/> Packets/second (10~10000)
▶ Port Scan Defense	<input type="checkbox"/> Enable <input type="text" value="200"/> Packets/second (10~10000)

To provide application servers in the Internet, administrator may need to open specific ports for the services. However, there are some risks to always open service ports in the Internet. In order to avoid such attack risks, it is important to enable IPS functions.

Intrusion Prevention System (IPS) is network security appliances that monitor network and/or system activities for malicious activity. The main functions of IPS are to identify malicious activity, log information about this activity, attempt to block/stop it and report it. You can enable the IPS function and check the listed intrusion activities when needed. You can also enable the log alerting so that system will record Intrusion events when corresponding intrusions are detected.

IPS Scenario

As shown in the diagram, the gateway serves as an E-mail server, Web Server and also provides TCP port 8080 for remote administration. So, remote users or unknown users can request those services from Internet. With IPS enabled, the gateway can detect incoming attack packets, including the TCP ports (25, 80, 110, 443 and 8080) with services. It will block the attack packets and let the normal access to pass through the gateway

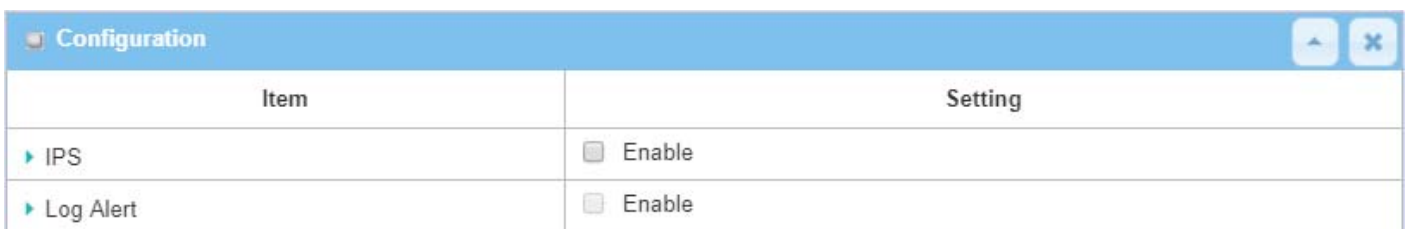

4G IIoT RTU

IPS Setting

Go to **Security > Firewall > IPS** Tab.

The Intrusion Prevention System (IPS) setting allows user to customize intrusion prevention rules to prevent malicious packets.

Enable IPS Firewall

The screenshot shows a configuration window titled "Configuration" with a table of settings. The table has two columns: "Item" and "Setting". There are two rows: "IPS" and "Log Alert". Both rows have an unchecked checkbox followed by the text "Enable".

Item	Setting
▶ IPS	<input type="checkbox"/> Enable
▶ Log Alert	<input type="checkbox"/> Enable

Configuration Window		
Item	Value setting	Description
IPS	The box is unchecked by default	Check the Enable box to activate IPS function
Log Alert	The box is unchecked by default	Check the Enable box to activate to activate Event Log.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

Setup Intrusion Prevention Rules

The router allows you to select intrusion prevention rules you may want to enable. Ensure that the IPS is enabled before we can enable the defense function.

4G IIoT RTU

Intrusion Prevention	
Item	Setting
▶ SYN Flood Defense	<input type="checkbox"/> Enable <input type="text" value="300"/> Packets/second (10~10000)

5.2.7 Options

Firewall Options							
Item		Setting					
▶ Stealth Mode		<input type="checkbox"/> Enable					
▶ SPI		<input checked="" type="checkbox"/> Enable					
▶ Discard Ping from WAN		<input type="checkbox"/> Enable					

Remote Administrator Host Definition							
ID	Interface	Protocol	IP	Subnet Mask	Service Port	Enable	Action
1	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
2	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
3	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
4	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
5	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit

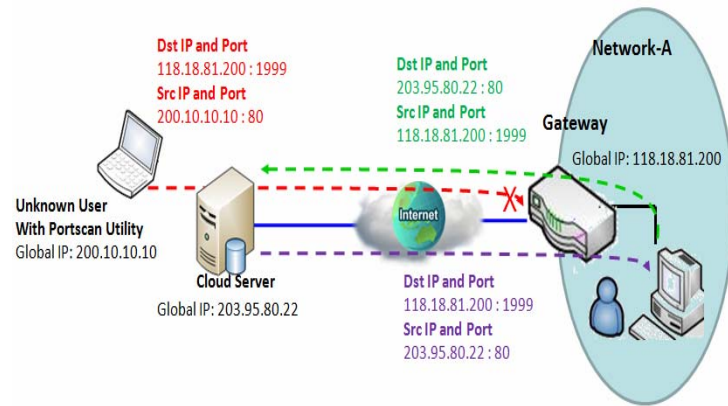

There are some additional useful firewall options in this page.

“Stealth Mode” lets gateway not to respond to port scans from the WAN so that makes it less susceptible to discovery and attacks on the Internet. “SPI” enables gateway to record the packet information like IP address, port address, ACK, SEQ number and so on while they pass through the gateway, and the gateway checks every incoming packet to detect if this packet is valid.

“Discard Ping from WAN” makes any host on the WAN side can't ping this gateway. And finally, “Remote Administrator Hosts” enables you to perform administration task from a remote host. If this feature is enabled, only specified IP address(es) can perform remote administration.

4G IIoT RTU

Enable SPI Scenario

As shown in the diagram, Gateway has the IP address of 118.18.81.200 for WAN interface and 192.168.1.253 for LAN interface. It serves as a NAT gateway. Users in Network-A initiate to access cloud server through the gateway. Sometimes, unknown users will simulate the packets but use different source IP to masquerade. With the SPI feature been enabled at the gateway, it will block such packets from unknown users.

Discard Ping from WAN & Remote Administrator Hosts Scenario

"Discard Ping from WAN" makes any host on the WAN side can't ping this gateway reply any ICMP packets. Enable the Discard Ping from WAN function to prevent security leak when local users surf the internet.

Remote administrator knows the gateway's global IP, and he can access the Gateway GUI via TCP port 8080.

4G IIoT RTU

Firewall Options Setting

Go to **Security > Firewall > Options** Tab.

The firewall options setting allows network administrator to modify the behavior of the firewall and to enable Remote Router Access Control.

▶ Discard Ping from WAN	<input type="checkbox"/> Enable

Item	Value setting	Description
Stealth Mode	The box is unchecked by default	Check the Enable box to activate the Stealth Mode function
SPI	The box is checked by default	Check the Enable box to activate the SPI function
Discard Ping from WAN	The box is unchecked by default	Check the Enable box to activate the Discard Ping from WAN function

Define Remote Administrator Host

The router allows network administrator to manage router remotely. The network administrator can assign specific IP address and service port to allow accessing the router via designated WAN interface.

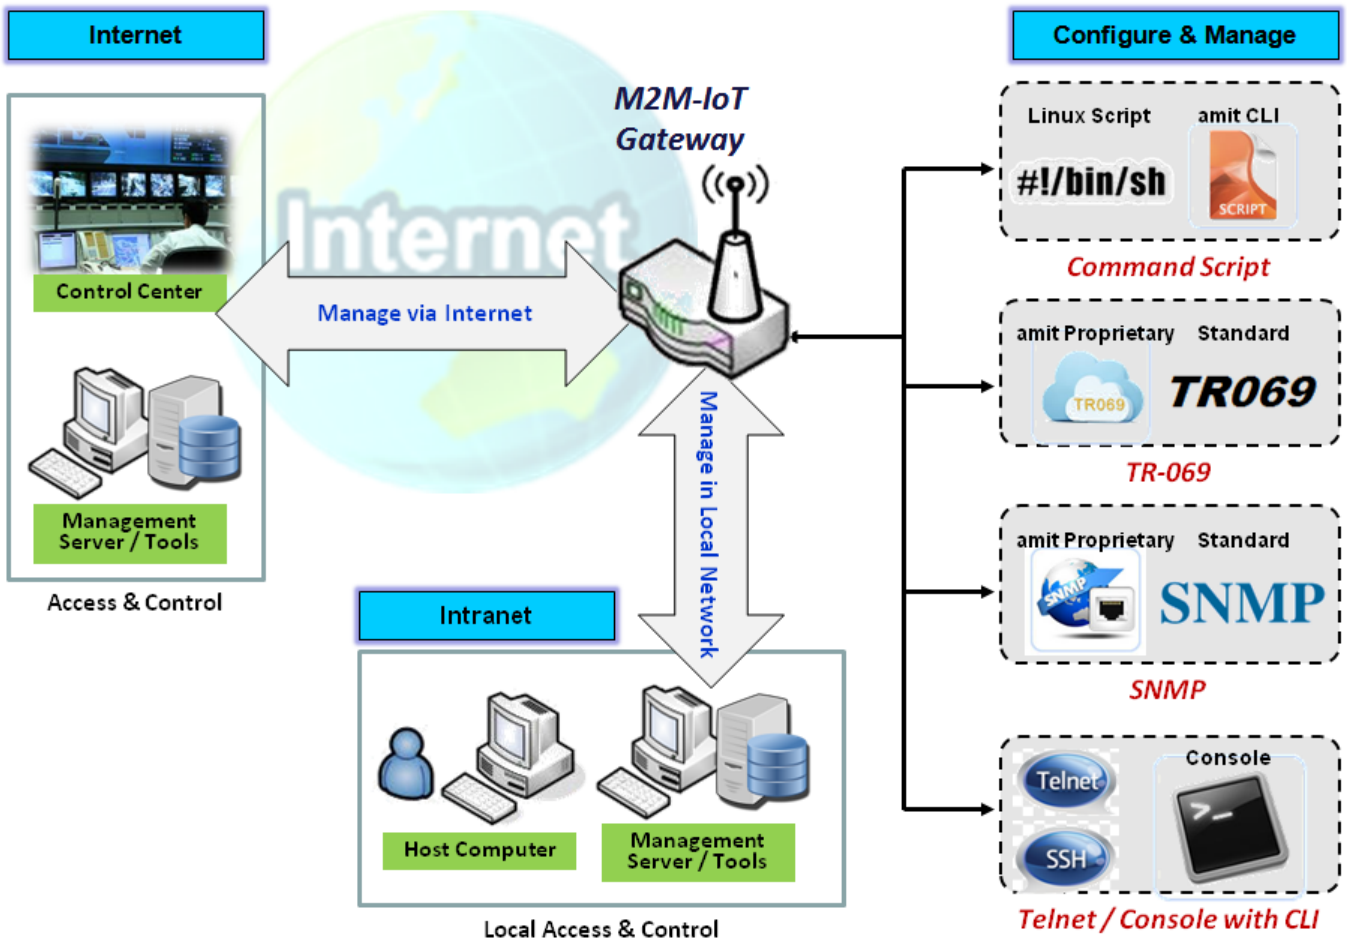

4G IIoT RTU

Remote Administrator Host Definition							
ID	Interface	Protocol	IP	Subnet Mask	Service Port	Enable	Action
1	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
2	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
3	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
4	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit
5	All WAN	HTTPS	Any IP	N/A	443	<input type="checkbox"/>	Edit

Remote Administrator Host Definition		
Item	Value setting	Description
Protocol	HTTPS is set by default	Select HTTP or HTTPS method for remote administration.
IP	A Must filled setting	This field is to specify the remote host to assign access right for remote access. Select Any IP to allow any remote hosts Select Specific IP to allow the remote host coming from a specific subnet. An IP address entered in this field and a selected Subnet Mask to compose the subnet.
Service Port	1. 80 for HTTP by default 2. 443 for HTTPS by default	This field is to specify a Service Port to HTTP or HTTPS connection. Value Range: 1 ~ 65535.
Enabling the rule	The box is unchecked by default.	Click Enable box to activate this rule.
Save	N/A	Click Enable box to activate this rule then save the settings.
Undo	N/A	Click Undo to cancel the settings

Chapter 6 Administration

6.1 Configure & Manage

Configure & Manage refers to enterprise-wide administration of distributed systems including (and commonly in practice) computer systems. Centralized management has a time and effort trade-off that is related to the size of the company, the expertise of the IT staff, and the amount of technology being used. This device supports many system management protocols, such as Command Script, TR-069, SNMP, and Telnet with CLI. You can setup those configurations in the "Configure & Manage" section.

4G IIoT RTU

6.1.1 Command Script

Command script configuration is the application that allows administrator to setup the pre-defined configuration in plain text style and apply configuration on startup.

Go to **Administration > Command Script > Configuration Tab.**

Enable Command Script Configuration

Item	Setting
▶ Command Script	<input type="checkbox"/> Enable
▶ Backup Script	Via Web UI
▶ Upload Script	Via Web UI
▶ Script Name	<input type="text"/>
▶ Version	<input type="text"/>
▶ Description	<input type="text"/>
▶ Update time	2019-04-08T18:05:31

Configuration Item	Value setting	Description
Command Script	The box is unchecked by default	Check the Enable box to activate the Command Script function.
Backup Script	N/A	Click the Via Web UI or Via Storage button to backup the existed command script in a .txt file. You can specify the script file name in Script Name below.
Upload Script	N/A	Click the Via Web UI or Via Storage button to Upload the existed command script from a specified .txt file.
Script Name	1.An Optional setting 2.Any valid file name	Specify a script file name for script backup, or display the selected upload script file name. Value Range: 0 ~ 32 characters.
Version	1.An Optional setting 2.Any string	Specify the version number for the applied Command script. Value Range: 0 ~ 32 characters.
Description	1.An Optional setting 2.Any string	Enter a short description for the applied Command script.
Update time	N/A	It records the upload time for last commad script upload.

4G IIoT RTU

Edit/Backup Plain Text Command Script

You can edit the plain text configuration settings in the configuration screen as above.

Plain Text Configuration		
Item	Value setting	Description
Clean	NA	Clean text area. (You should click Save button to further clean the configuration already saved in the system.)
Backup	NA	Backup and download configuration.
Save	NA	Save configuration

The supported plain text configuration items are shown in the following list. For the settings that can be executed with standard Linux commands, you can put them in a script file, and apply to the system configure with **STARTUP** command. For those configurations without corresponding Linux command set to configure, you can configure them with proprietary command set.

Configuration Content		
Key	Value setting	Description
OPENVPN_ENABLED	1 : enable 0 : disable	Enable or disable OpenVPN Client function.
OPENVPN_DESCRIPTION	A Must filled Setting	Specify the tunnel name for the OpenVPN Client connection.
OPENVPN_PROTO	udp tcp	Define the Protocol for the OpenVPN Client. <ul style="list-style-type: none">• Select TCP or TCP /UDP ->The OpenVPN will use TCP protocol, and Port will be set as 443 automatically.• Select UDP -> The OpenVPN will use UDP protocol, and Port will be set as 1194 automatically.
OPENVPN_PORT	A Must filled Setting	Specify the Port for the OpenVPN Client to use.
OPENVPN_REMOTE_IPADDR	IP or FQDN	Specify the Remote IP/FQDN of the peer OpenVPN Server for this OpenVPN Client tunnel. Fill in the IP address or FQDN.
OPENVPN_PING_INTVL	seconds	Specify the time interval for OpenVPN keep-alive checking.

4G IIoT RTU

OPENVPN_PING_TOUT	seconds	Specify the timeout value for OpenVPN Client keep-alive checking.
OPENVPN_COMP	Adaptive	Specify the LZO Compression algorithm for OpenVPN client.
OPENVPN_AUTH	Static Key/TLS	Specify the authorization mode for the OpenVPN tunnel. <ul style="list-style-type: none"> • TLS ->The OpenVPN will use TLS authorization mode, and the following items CA Cert. , Client Cert. and Client Key need to specify as well.
OPENVPN_CA_CERT	A Must filled Setting	Specify the Trusted CA certificate for the OpenVPN client. It will go through Base64 Conversion.
OPENVPN_LOCAL_CERT	A Must filled Setting	Specify the local certificate for OpenVPN client. It will go through Base64 Conversion.
OPENVPN_LOCAL_KEY	A Must filled Setting	Specify the local key for the OpenVPN client. It will go through Base64 Conversion.
OPENVPN_EXTRA_OPTS	Options	Specify the extra options setting for the OpenVPN client.
IP_ADDR1	Ip	Ethernet LAN IP
IP_NETM1	Net mask	Ethernet LAN MASK
PPP_MONITORING	1 : enable 0 : disable	When the Network Monitoring feature is enabled, the router will use DNS Query or ICMP to periodically check Internet connection – connected or disconnected.
PPP_PING	0 : DNS Query 1 : ICMP Query	With DNS Query , the system checks the connection by sending DNS Query packets to the destination specified in PPP_PING_IPADDR. With ICMP Query , the system will check connection by sending ICMP request packets to the destination specified in PPP_PING_IPADDR.
PPP_PING_IPADDR	IP	Specify an IP address as the target for sending DNS query/ICMP request.
PPP_PING_INTVL	seconds	Specify the time interval for between two DNS Query or ICMP checking packets.
STARTUP	Script file	For the configurations that can be configured with standard Linux commands, you can put them in a script file, and apply the script file with STARTUP command. For example, STARTUP=#!/bin/sh STARTUP=echo “startup done” > /tmp/demo

Plain Text System Configuration with Telnet

In addition to the web-style plain text configuration as mentioned above, the gateway system also allow the configuration via Telnet CLI. Administrator can use the proprietary telnet command “**txtConfig**” and related action items to perform the plain system configuration.

The command format is: `txtConfig (action) [option]`

Action	Option	Description
clone	<i>Output file</i>	Duplicate the configuration content from database and stored as a configuration file. (ex: <code>txtConfig clone /tmp/config</code>) The contents in the configuration file are the same as the plain text commands mentioned above. This action is exactly the same as performing the “Backup” plain text configuration.

4G IIoT RTU

commit	a existing file	Commit the configuration content to database. (ex: <i>txtConfig commit /tmp/config</i>)
enable	NA	Enable plain text system config. (ex: <i>txtConfig enable</i>)
disable	NA	Disable plain text system config. (ex: <i>txtConfig disable</i>)
run_immediately	NA	Apply the configuration content that has been committed in database. (ex: <i>txtConfig run_immediately</i>)
run_immediately	a existing file	Assign a configuration file to apply. (ex: <i>txtConfig run_immediately /tmp/config</i>)

4G IIoT RTU

6.1.2 TR-069

TR-069 (Technical Report 069) is a Broadband Forum technical specification entitled CPE WAN Management Protocol (CWMP). It defines an application layer protocol for remote management of end-user devices, like this gateway device. As a bidirectional SOAP/HTTP-based protocol, it provides the communication between customer-premises equipment (CPE) and Auto Configuration Servers (ACS). The Security Gateway is such CPE.

TR-069 is a customized feature for ISP. It is not recommend that you change the configuration for this. If you have any problem in using this feature for device management, please contact with your ISP or the ACS provider for help. At the right upper corner of TR-069 Setting screen, one “[Help]” command let you see the same message about that.

Scenario - Managing deployed gateways through an ACS Server

Scenario Application Timing

When the enterprise data center wants to use an ACS server to manage remote gateways geographically distributed elsewhere in the world, the gateways in all branch offices must have an embedded TR-069 agent to communicate with the ACS server. So that the ACS server can configure, FW upgrade and monitor these gateways and their corresponding Intranets.

Scenario Description

The ACS server can configure, upgrade with latest FW and monitor these gateways.

Remote gateways inquire the ACS server for jobs to do in each time period.

The ACS server can ask the gateways to execute some urgent jobs.

4G IIoT RTU

Parameter Setup Example

Following tables list the parameter configuration as an example for the Gateway 1 in above diagram with "TR-069" enabling.

Use default value for those parameters that are not mentioned in the tables.

Configuration Path	[TR-069]-[Configuration]
TR-069	■ <i>Enable</i>
ACS URL	http://qa.acslite.com/cpe.php
ACS User Name	<i>ACSUserName</i>
ACS Password	<i>ACSPassword</i>
ConnectionRequest Port	<i>8099</i>
ConnectionRequest User Name	<i>ConnReqUserName</i>
ConnectionRequest Password	<i>ConnReqPassword</i>
Inform	■ <i>Enable Interval 900</i>

Scenario Operation Procedure

In above diagram, the ACS server can manage multiple gateways in the Internet. The "Gateway 1" is one of them and has 118.18.81.33 IP address for its WAN-1 interface.

When all remote gateways have booted up, they will try to connect to the ACS server.

Once the connections are established successfully, the ACS server can configure, upgrade with latest FW and monitor these gateways.

Remote gateways inquire the ACS server for jobs to do in each time period.

If the ACS server needs some urgent jobs to be done by the gateways, it will issue the "Connection Request" command to those gateways. And those gateways make immediate connections in response to the ACS server's immediate connection request for executing the urgent jobs.

4G IIoT RTU

TR-069 Setting

Go to **Administration > Configure & Manage > TR-069** tab.

In "TR-069" page, there is only one configuration window for TR-069 function. In the window, you must specify the related information for your security gateway to connect to the ACS. Drive the function to work by specifying the URL of the ACS server, the account information to login the ACS server, the service port and the account information for connection requesting from the ACS server, and the time interval for job inquiry. Except the inquiry time, there are no activities between the ACS server and the gateways until the next inquiry cycle. But if the ACS server has new jobs that are expected to do by the gateways urgently, it will ask these gateways by using connection request related information for immediate connection for inquiring jobs and executing.

Enable TR-069

Item	Setting
▶ TR-069	<input checked="" type="checkbox"/> Enable
▶ Interface	WAN-1 ▾
▶ Data model	ACS Cloud Data Model ▾
▶ ACS URL	<input type="text"/>

Save	N/A	Click Save to save the settings.
Undo	N/A	Click Undo to cancel the modifications.

4G IIoT RTU

6.1.3 SNMP

In brief, SNMP, the Simple Network Management Protocol, is a protocol designed to give a user the capability to remotely manage a computer network by polling and setting terminal values and monitoring network events.

In typical SNMP uses, one or more administrative computers, called managers, have the task of monitoring or managing a group of hosts or devices on a computer network. Each managed system executes, at all times, a software component called an agent which reports information via SNMP to the manager.

SNMP agents expose management data on the managed systems as variables. The protocol also permits active management tasks, such as modifying and applying a new configuration through remote modification of these variables. The variables accessible via SNMP are organized in hierarchies. These hierarchies, and other metadata (such as type and description of the variable), are described by Management Information Bases (MIBs).

The device supports several public MIBs and one private MIB for the SNMP agent. The supported MIBs are as follow: MIB-II (RFC 1213, Include IPv6), IF-MIB, IP-MIB, TCP-MIB, UDP-MIB, SMIV1 and SMIV2, SNMPv2-TM and SNMPv2-MIB, and AMIB (a Proprietary MIB)

SNMP Management Scenario

Scenario Application Timing

There are two application scenarios of SNMP Network Management Systems (NMS). Local NMS is in

4G IIoT RTU

the Intranet and manage all devices that support SNMP protocol in the Intranet. Another one is the Remote NMS to manage some devices whose WAN interfaces are connected together by using a switch or a router with UDP forwarding. If you want to manage some devices and they all have supported SNMP protocol, use either one application scenario, especially the management of devices in the Intranet. In managing devices in the Internet, the TR-069 is the better solution. Please refer to last sub-section.

Scenario Description

The NMS server can monitor and configure the managed devices by using SNMP protocol, and those devices are located at where UDP packets can reach from NMS.

The managed devices report urgent trap events to the NMS servers.

Use SNMPv3 version of protocol can protected the transmitting of SNMP commands and responses.

The remote NMS with privilege IP address can manage the devices, but other remote NMS can't.

Parameter Setup Example

Following tables list the parameter configuration as an example for the Gateway 1 in above diagram with "SNMP" enabling at LAN and WAN interfaces.

Use default value for those parameters that are not mentioned in the tables.

Configuration Path	[SNMP]-[Configuration]
SNMP Enable	■ LAN ■ WAN
Supported Versions	■ v1 ■ v2c ■ v3
Get / Set Community	ReadCommunity / WriteCommunity
Trap Event Receiver 1	118.18.81.11
WAN Access IP Address	118.18.81.11

Configuration Path	[SNMP]-[User Privacy Definition]		
ID	1	2	3
User Name	UserName1	UserName2	UserName3
Password	Password1	Password2	Disable
Authentication	MD5	SHA-1	Disable
Encryption	DES	Disable	Disable
Privacy Mode	authPriv	authNoPriv	noAuthNoPriv
Privacy Key	12345678	Disable	Disable
Authority	Read/Write	Read	Read
Enable	■ Enable	■ Enable	■ Enable

Scenario Operation Procedure

In above diagram, the NMS server can manage multiple devices in the Intranet or a UDP-reachable network. The "Gateway 1" is one of the managed devices, and it has the IP address of 10.0.75.2 for

4G IIoT RTU

LAN interface and 118.18.81.33 for WAN-1 interface. It serves as a NAT router.

At first stage, the NMS manager prepares related information for all managed devices and records them in the NMS system. Then NMS system gets the status of all managed devices by using SNMP get commands.

When the manager wants to configure the managed devices, the NMS system allows him to do that by using SNMP set commands. The "UserName1" account is used if the manager uses SNMPv3 protocol for configuring the "Gateway 1". Only the "UserName1" account can let the "Gateway 1" accept the configuration from the NMS since the authority of the account is "Read/Write".

Once a managed device has an urgent event to send, the device will issue a trap to the Trap Event Receivers. The NMS itself could be one among them.

If you want to secure the transmitted SNMP commands and responses between the NMS and the managed devices, use SNMPv3 version of protocol.

The remote NMS without privilege IP address can't manage the "Gateway 1", since "Gateway 1" allows only the NMS with privilege IP address can manage it via its WAN interface.

4G IIoT RTU

SNMP Setting

Go to **Administration > Configure & Manage > SNMP** tab.

The SNMP allows user to configure SNMP relevant setting which includes interface, version, access control and trap receiver.

Enable SNMP

Configuration																					
Item	Setting

	Number) 2. A Must filled setting 3. String format: any number	
Enterprise OID	1. The default value is 1.3.6.1.4.1.12823.4.4.9 (Default Enterprise OID) 2. A Must filled setting 3. String format: any legal OID	Specify the Enterprise OID for the particular private MIB. The range of the each OID number is 1-2080768. The maximum length of the enterprise OID is 31. The seventh number must be identical with the enterprise number.
Save	N/A	Click the Save button to save the configuration and apply your changes to SNMP functions.
Undo	N/A	Click the Undo button to cancel the settings.

4G IIoT RTU

6.1.4 Telnet & SSH

A command-line interface (CLI), also known as command-line user interface, and console user interface are means of interacting with a computer program where the user (or client) issues commands to the program in the form of successive lines of text (command lines). The interface is usually implemented with a command line shell, which is a program that accepts commands as text input and converts commands to appropriate operating system functions. Programs with command-line interfaces are generally easier to automate via scripting. The device supports both Telnet and SSH (Secure Shell) CLI with default service port 23 and 22, respectively.

Telnet & SSH Scenario

Scenario Application Timing

When the administrator of the gateway wants to manage it from remote site in the Intranet or Internet, he may use "Telnet with CLI" function to do that by using "Telnet" or "SSH" utility.

Scenario Description

The Local Admin or the Remote Admin can manage the Gateway by using "Telnet" or "SSH" utility with privileged user name and password.

The data packets between the Local Admin and the Gateway or between the Remote Admin and the Gateway can be plain texts or encrypted texts. Suggest they are plain texts in the Intranet for Local Admin to use "Telnet" utility, and encrypted texts in the Internet for Remote Admin to use "SSH"

4G IIoT RTU

utility.

Parameter Setup Example

Following table lists the parameter configuration as an example for the Gateway in above diagram with "Telnet with CLI" enabling at LAN and WAN interfaces.

Use default value for those parameters that are not mentioned in the table.

Configuration Path	[Telnet & SSH]-[Configuration]
Telnet	LAN: <input checked="" type="checkbox"/> <i>Enable</i> WAN: <input type="checkbox"/> <i>Enable</i> Service Port: 23
SSH	LAN: <input checked="" type="checkbox"/> <i>Enable</i> WAN: <input checked="" type="checkbox"/> <i>Enable</i> Service Port: 22

Scenario Operation Procedure

In above diagram, "Local Admin" or "Remote Admin" can manage the "Gateway" in the Intranet or Internet. The "Gateway" is the gateway of Network-A, and the subnet of its Intranet is 10.0.75.0/24. It has the IP address of 10.0.75.2 for LAN interface and 118.18.81.33 for WAN-1 interface. It serves as a NAT gateway.

The "Local Admin" in the Intranet uses "Telnet" utility with privileged account to login the Gateway.

Or the "Remote Admin" in the Internet uses "SSH" utility with privileged account to login the Gateway.

The administrator of the gateway can control the device as like he is in front of the gateway.

4G IIoT RTU

Telnet & SSH Setting

Go to Administration > Configure & Manage > Telnet & SSH tab.

The Telnet & SSH setting allows administrator to access this device through the traditional Telnet or SSH Telnet program. Before you can telnet (login) to the device, please configure the related settings with care.

The screenshot shows a configuration window titled "Configuration" with "Save" and "Undo" buttons. It contains two sections: "Telnet" and "SSH". Each section has "LAN" and "WAN" enable checkboxes, a dropdown menu for interface selection, and a "Service Port" input field. For Telnet, the Service Port is set to 23. For SSH, the Service Port is set to 22.

Configuration		
Item	Value setting	Description
Telnet	<ol style="list-style-type: none">The LAN Enable box is checked by default.By default Service Port is 23.	Check the Enable box to activate the Telnet function for connecting from LAN or WAN interfaces. You can set which number of Service Port you want to provide for the corresponding service. Value Range: 1 ~65535.
SSH	<ol style="list-style-type: none">The LAN Enable box is checked by default.By default Service Port is 22.	Check the Enable box to activate the SSH Telnet function for connecting from LAN or WAN interfaces. You can set which number of Service Port you want to provide for the corresponding service. Value Range: 1 ~65535.
Save	N/A	Click Save to save the settings
Undo	N/A	Click Undo to cancel the settings

Note: The Telnet/SSH login password is the same one as the administrator's login password for the device web GUI.

4G IIoT RTU

6.2 System Operation

System Operation allows the network administrator to manage system, settings such as web-based utility access password change, system information, system time, system log, firmware/configuration backup & restore, and reset & reboot.

6.2.1 Password & MMI

Go to **Administration > System Operation > Password & MMI** tab.

Setup Host Name

Host Name screen allows network administrator to setup / change the host name of the gateway. Click the **Modify** button and provide the new username setting.

Item	Setting
▶ Host Name	<input type="text"/>

Username Configuration		
Item	Value setting	Description
Host Name	1. An Optional setting 2. It is blanked by default	Enter the host name of the gateway.
Save	N/A	Click Save button to save the settings
Undo	N/A	Click Undo button to cancel the settings

Change UserName

Username screen allows network administrator to change the web-based MMI login account to access gateway. Click the **Modify** button and provide the new username setting.

Item	Setting
▶ Username	admin <input type="button" value="Modify"/>
▶ New Username	<input type="text"/>
▶ Password	<input type="text"/>

4G IIoT RTU

Username Configuration		
Item	Value setting	Description
Username	1. The default Username for web-based MMI is 'admin'.	Display the current MMI login account (Username).
New Username	String: any text	Enter new Username to replace the current setting.
Password	String: any text	Enter current password to verify if you have the permission to change the username setting.
Save	N/A	Click Save button to save the settings
Undo	N/A	Click Undo button to cancel the settings

Change Password

Change password screen allows network administrator to change the web-based MMI login password to access gateway.

Password
⏪ ⏩ ✕

Item	Setting
▶ Old Password	<input type="text"/>
▶ New Password	<input type="text"/> <div style="color: red; font-size: 0.8em; margin-top: 2px;"> (NOTE: The password must be at least 10 characters long, and must contain at least 1 English letter and 1 number. The password cannot be the same as the login account.) </div>
▶ New Password Confirmation	<input type="text"/>

Password Configuration		
Item	Value setting	Description
Old Password	1. String: any text 2. The default password for web-based MMI is 'admin'.	Enter the current password to enable you unlock to change password.
New Password	String: any text	Enter new password NOTE: There are some limitation on setting the new password for enhancing the security. The password length must be at least 10 characters, and there must be at least one English character and one numeric character. Beside, the new password must be different to the existing one.
New Password Confirmation	String: any text	Enter new password again to confirm
Save	N/A	Click Save button to save the settings
Undo	N/A	Click Undo button to cancel the settings

4G IIoT RTU

Change MMI Setting for Accessing

This is the gateway’s web-based MMI access which allows administrator to access the gateway for management. The gateway’s web-based MMI will automatically logout when the idle time has elapsed. The setting allows administrator to enable automatic logout and set the logout idle time. When the login timeout is disabled, the system won’t logout the administrator automatically.

Item	Setting
▶ Login	Password-Guessing Attack & MAX: <input type="text" value="3"/> (times)
▶ Login Timeout	<input checked="" type="checkbox"/> Enable <input type="text" value="300"/> (seconds)
▶ GUI Access Protocol	<input type="text" value="http/https"/>
▶ External Authentication	<input type="checkbox"/> Enable Type <input type="text" value="RADIUS"/> Primary Server <input type="text" value="-- Option --"/> Secondary Server <input type="text" value="-- Option --"/>
▶ HTTPs Certificate Setup	<input checked="" type="radio"/> default <input type="radio"/> Select from Certificate List Certificate: <input type="text"/> Key: <input type="text"/>
▶ HTTP Compression	<input type="checkbox"/> gzip <input type="checkbox"/> deflate
▶ HTTP Binding	<input checked="" type="checkbox"/> DHCP 1
▶ System Boot Mode	<input type="text" value="Normal Mode"/>

MMI Configuration		
Item	Value setting	Description
Login	3 times is set by default	Enter the login trial counting value. Value Range: 3 ~ 10. If someone tried to login the web GUI with incorrect password for more than the counting value, an warning message “ Already reaching maximum Password-Guessing times, please wait a few seconds! ” will be displayed and ignore the following login trials.
Login Timeout	The Enable box is checked, and 300 is set by default.	Check the Enable box to activate the auto logout function, and specify the maximum idle time as well. Value Range: 30 ~ 65535.
GUI Access Protocol	http/https is selected by default.	Select the protocol that will be used for GUI access. It can be http/https , http only , or https only .
HTTPs Certificate Setup	The default box is selected by default	If the https Access Protocol is selected, the HTTPs Certificate Setup option will be available for further configuration. You can leave it as default or select a expected certificate and key from the

4G IIoT RTU

		drop down list. Refer to Object Definition > Certificate Section for the Certificate configuration.
HTTP Compression	The box is unchecked by default.	Check the box (gzip , or deflate) if any compression method is preferred.
HTTP Binding	1. An Optional setting 2. DHCP-1 is checked by default	Select the DHCP Server to bind with http access.
System Boot Mode	Normal Mode is selected by default.	Select the system boot mode that will be adopted to boot up the device. Normal Mode: It takes longer boot up time, with complete firmware image check during the device booting. Fast Mode: It takes shorter boot up time, without checking the firmware image during the device booting.
Save	N/A	Click Save button to save the settings
Undo	N/A	Click Undo button to cancel the settings

System Time	N/A	It displays the current system time that you browsed this web page.
Device Up-Time	N/A	It displays the statistics for the device up-time since last boot up.
Refresh	N/A	Click the Refresh button to update the system Information immediately.

4G IIoT RTU

6.2.3 System Time

The gateway provides manually setup and auto-synchronized approaches for the administrator to setup the system time for the gateway. The time supported synchronization methods can be Time Server, Manual, PC, Cellular Module, or GPS Signal. Select the method first, and then configure rest settings.

Instead of manually configuring the system time for the gateway, there are two simple and quick solutions for you to set the correct time information and set it as the system time for the gateway.

The first one is “Sync with Timer Server”. Based on your selection of time zone and time server in above time information configuration window, system will communicate with time server by NTP Protocol to get system date and time after you click on the **Synchronize immediately** button.

The second one is “Sync with my PC”. Select the method and the system will synchronize its date and time to the time of the administration PC.

Go to **Administration > System Operation > System Time** tab.

Synchronize with Time Server

Item	Setting
▶ Synchronization method	Time Server ▾
▶ Time Zone	(GMT+00:00) Greenwich Mean Time: Dublin, Edinburgh, Lisbon, London ▾
▶ Auto-synchronization	Time Server: <input type="text"/> Available Time Servers (RFC-868): Auto ▾
▶ Daylight Saving Time	<input type="checkbox"/> Enable
▶ NTP Service	<input type="checkbox"/> Enable
▶ Synchronize immediately	Active

System Time Information		
Item	Value Setting	Description
Synchronization method	1. A Must-filled item. 2. Time Server is selected by default.	Select the Time Server as the synchronization method for the system time.
Time Zone	1. A GMT+00 :00 item. 2. GMT+00 :00 is selected by default.	Select a time zone where this device locates.
Auto-synchronization	1. A Must-filled item. 2. Auto is selected by	Enter the IP or FQDN for the NTP time server you expected, or leave it as auto mode so that the available server will be used for time synchronization one by

6.2.5 Backup & Restore

In the Backup & Restore window, you can upgrade the device firmware when new firmware is available and also backup / restore the device configuration.

In addition to the factory default settings, you can also customize a special configuration setting as a customized default value. With this customized default value, you can reset the device to the expected default setting if needed.

Go to **Administration > System Operation > Backup & Restore** tab.

FW Backup & Restore	
Item	Setting
▶ FW Upgrade	Via Web UI ▼ FW Upgrade
▶ Backup Configuration Settings	Download ▼ Via Web UI
▶ Auto Restore Configuration	<input type="checkbox"/> Enable Save Conf. Clean Conf. Conf. Info.
▶ Self-defined Logo	Download ▼ Via Web UI Reset
▶ Self-defined CSS	Edit : Download ▼ Via Web UI Reset

FW Backup & Restore		
Item	Value Setting	Description
FW Upgrade	Via Web UI is selected by default	If new firmware is available, click the FW Upgrade button to upgrade the device firmware via Web UI , or Via Storage . After clicking on the “FW Upgrade” command button, you need to specify the file name of new firmware by using “Browse” button, and then click “Upgrade” button to start the FW upgrading process on this device. If you want to upgrade a firmware which is from GPL policy, please check “Accept unofficial firmware”
Backup Configuration Settings	Download is selected by default	You can backup or restore the device configuration settings by clicking the Via Web UI button. Download: for backup the device configuration to a config.bin file. Upload: for restore a designated configuration file to the device. Via Web UI: to retrieve the configuration file via Web GUI.
Auto Restore Configuration	The Enable box is unchecked by default	Click the Enable button to activate the customized default setting function. Once the function is activated, you can save the expected setting as a customized default setting by clicking the Save Conf. button, or clicking the Clean Conf. button to erase the stored customized configuration.

4G IIoT RTU

6.2.6 Reboot & Reset

For some special reason or situation, you may need to reboot the gateway or reset the device configuration to its default value. In addition to perform these operations through the Power ON/OFF, or pressing the reset button on the device panel, you can do it through the web GUI too.

Go to **Administration > System Operation > Reboot & Reset** tab.

In the Reboot & Reset window, you can reboot this device by clicking the “Reboot” button, and reset this device to default settings by clicking the “Reset” button.

System Operation Window		
Item	Value Setting	Description
Reboot	Now is selected by default	Click the Reboot button to reboot the gateway immediately or on a pre-defined time schedule. Now: Reboot immediately Time Schedule: Select a pre-defined auto-reboot time schedule rule to reboot the auto device on a designated tim. To define a time schedule rule, go to Object Definition > Scheduling > Configuration tab.
Reset to Default	N/A	Click the Reset button to reset the device configuration to its default value.

4G IIoT RTU

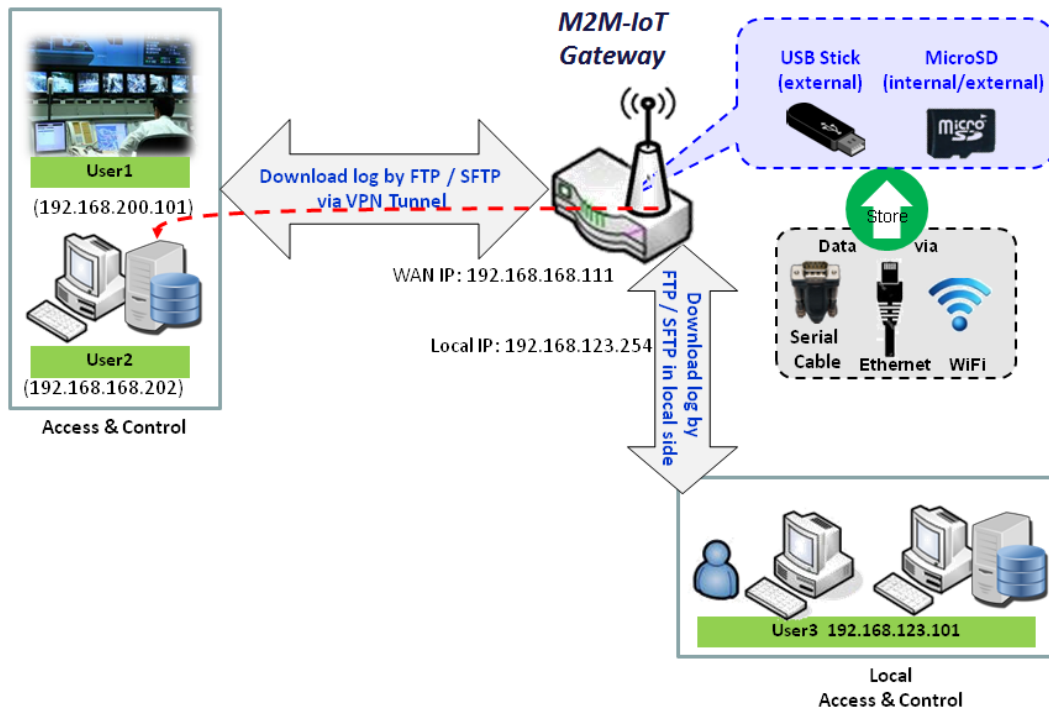

6.3 FTP

The File Transfer Protocol (FTP) is a standard network protocol used to transfer computer files between a client and server on a computer network. FTP is built on a client-server model architecture and uses separate control and data connections between the client and the server. FTP users may authenticate themselves with a clear-text sign-in protocol, normally in the form of a username and password, but can connect anonymously if the server is configured to allow it.

For secure transmission that protects the username and password, and encrypts the content, FTP is often secured with SSL/TLS (FTPS). Besides, SSH File Transfer Protocol (SFTP) is sometimes also used instead, but is technologically different.

This gateway embedded FTP / SFTP server for administrator to download the log files to his computer or database. In the following two sections, you can configure the FTP server and create the user accounts that can login to the server. After login to the FTP server, you can browse the log directory and have the permission to download the stored log files and delete the files you have downloaded to make more storage space for further data logs.

The available log files can be system logs (refer to Administration > System Operation > System Log), Network Packets (refer to Administrator > Diagnostic > Packet Analyzer), Data Log (refer to Field Communication > Data Logging > Log File Management), and GNSS Log (refer to Service > Location Tracking > GNSS). With proper configuration for the various log functions that supported on your purchased product, you can download the log via FTP / SFTP connections.

4G IIoT RTU

6.3.1 Server Configuration

This section allows user to setup the embedded FTP and SFTP server for retrieving the interested fog files.

Go to **Administration > FTP > Server Configuration** tab.

Enable FTP Server

Item	Setting
▶ FTP	<input checked="" type="checkbox"/> Enable
▶ FTP Port	<input type="text" value="21"/>
▶ Timeout	<input type="text" value="300"/> second(s)(60-7200)
▶ Max. Connections per IP	<input type="text" value="2"/> ▼
▶ Max. FTP Clients	<input type="text" value="5"/> ▼
▶ PASV Mode	<input type="checkbox"/> Enable
▶ Port Range of PASV Mode	<input type="text" value="50000"/> ~ <input type="text" value="50031"/>
▶ Auto Report External IP in PASV Mode	<input type="checkbox"/> Enable
▶ ASCII Transfer Mode	<input type="checkbox"/> Enable
▶ FTPS(FTP over SSL/TLS)	<input type="checkbox"/> Enable

Configuration Item	Value setting	Description
FTP	The box is unchecked by default.	Check Enable box to activate the embedded FTP Server function. With the FTP Server enabled, you can retrieve or delete the stored log files via FTP connection. Note: The embedded FTP Server is only for log downloading, so no any write permission is implemented for user file upload to the storage.
FTP Port	Port 21 is set by default	Specify a port number for FTP connection. The gateway will listen for incoming FTP connections on the specified port. Value Range: 1 ~ 65535.
Timeout	300 seconds is set by default.	Specify the maximum timeout interval for the FTP connection. Supported range is 60 to 7200 seconds.
Max. Connections per IP	2 Clients are set by default.	Specify the maximum number of clients from the same IP address for the FTP connection. Up to 5 clients from the same IP address is supported.
Max. FTP Clients	5 Clients are set by default.	Specify the maximum number of clients for the FTP connection. Up to 32 clients is supported.
PASV Mode	Optional setting	Check the Enable box to activate the support of PASV mode for a FTP connection from FTP clients.

4G IIoT RTU

Port Range of PASV Mode	Port 50000 ~ 50031 is set by default.	Specify the port range to allocate for PASV style data connection. Value Range: 1024 ~ 65535.
Auto Report External IP in PASV Mode	Optional setting	Check the Enable box to activate the support of overriding the IP address advertising in response to the PASV command.
ASCII Transfer Mode	Optional setting	Check the Enable box to activate the support of ASCII mode data transfers. Binary mode is supported by default.
FTPS (FTP over SSL/TLS)	Optional setting	Check the Enable box to activate the support of secure connections via SSL/TLS.

Enable SFTP Server

Item	Setting
▶ SFTP	<input type="checkbox"/> Enable via <input checked="" type="checkbox"/> LAN via <input checked="" type="checkbox"/> WAN (WAN-1 <input checked="" type="checkbox"/> WAN-4 <input type="checkbox"/>) <input type="text"/>
▶ SFTP Port	<input type="text" value="22"/>

Configuration		
Item	Value setting	Description
SFTP	The box is unchecked by default.	Check Enable box to activate the embedded SFTP Server function. Furthermore, you can check the granted interface(s) for the SFTP connection, via LAN , WAN , or both. <ul style="list-style-type: none"> With the SFTP Server enabled, you can retrieve or delete the stored log files via secure SFTP connection.
SFTP Port	Default 22	Specify a port number for SFTP connection. The gateway will listen for incoming SFTP connections on the specified port. Value Range: 1 ~ 65535.

4G IIoT RTU

6.3.2 User Account

This section allows user to setup user accounts for logging to the embedded FTP and SFTP server to retrieve the interested fog files.

Go to **Administration > FTP > User Account** tab.

Create/Edit FTP User Accounts

ID	User Name	Password	Directory	Permission	Enable	Actions
----	-----------	----------	-----------	------------	--------	---------

When **Add** button is applied, **User Account Configuration** screen will appear.

Item	Setting
User Name	admin
Password
Directory	Browse
Permission	Read/Write ▾
Enable	<input checked="" type="checkbox"/>

Configuration Item	Value setting	Description
User Name	String : non-blank string	Enter the user account for login to the FTP server. Value Range: 1 ~ 15 characters.
Password	String : no blank	Enter the user password for login to the FTP server.
Directory	N/A	Select a root directory after user login.
Permission	Read/Write is selected by default.	Select the Read/write permission. Note: The embedded FTP Server is only for log downloading, so no any write permission is implemented for user file upload to the storage, even Read/Write option is selected.
Enable	The box is checked by default.	Check the box to activate the FTP user account.

4G IIoT RTU

6.4 Diagnostic

This gateway supports simple network diagnosis tools for the administrator to troubleshoot and find the root cause of the abnormal behavior or traffics passing through the gateway. There can be a Packet Analyzer to help record the packets for a designated interface or specific source/destination host, and another Ping and Tracert tools for testing the network connectivity issues.

6.4.1 Diagnostic Tools

The Diagnostic Tools provide some frequently used network connectivity diagnostic tools (approaches) for the network administrator to check the device connectivity.

Go to **Administration > Diagnostic > Diagnostic Tools** tab.

Item	Setting
▶ Ping Test	Host IP: <input type="text"/> Outer Interface: <input type="text" value="Auto"/> LAN Source: <input type="text" value="Default"/> <input type="button" value="Ping"/>
▶ Tracert Test	Host IP: <input type="text"/> Interface: <input type="text" value="Auto"/> <input type="text" value="UDP"/> <input type="button" value="Tracert"/>
▶ Wake on LAN	<input type="text"/> <input type="button" value="Wake up"/>

Diagnostic Tools		
Item	Value setting	Description
Ping Test	Optional Setting	This allows you to specify an IP / FQDN, the Outer interface (auto, WAN, LAN, or VLAN), and LAN source (default, LAN, or VLAN) as well, so system will try to ping the specified device to test whether it is alive after clicking on the Ping button. A test result window will appear beneath it.
Tracert Test	Optional setting	Trace route (tracert) command is a network diagnostic tool for displaying the route (path) and measuring transit delays of packets across an IP network. Trace route proceeds until all (three) sent packets are lost for more than twice, then the connection is lost and the route cannot be evaluated. First, you need to specify an IP / FQDN, the test interface (LAN, WAN, or Auto) and the protocol (UDP or ICMP), and by default, it is UDP . Then, system will try to trace the specified host to test whether it is alive after clicking on Tracert button. A test result window will appear beneath it.
Wake on LAN	Optional setting	Wake on LAN (WOL) is an Ethernet networking standard that allows a computer to be turned on or awakened by a network message. You can specify the MAC address of the computer, in your LAN network, to be remotely turned on by clicking on the Wake up command button.
Save	N/A	Click the Save button to save the configuration.

4G IIoT RTU

6.4.2 Packet Analyzer

The Packet Analyzer can capture packets depend on user settings. User can specify interfaces to capture packets and filter by setting rule. Ensure the log storage is available (either embedded SD-Card or external USB Storage), otherwise **Packet Analyzer** cannot be enabled.

Go to **Administration > Diagnostic > Packet Analyzer** tab.

Item	Setting
▶ Packet Analyzer	<input type="checkbox"/> Enable
▶ File Name	<input type="text"/>
▶ Split Files	<input type="checkbox"/> Enable File Size : <input type="text" value="200"/> KB ▾
▶ Packet Interfaces	<input type="checkbox"/> WAN-1 <input type="checkbox"/> WAN-2 <input type="checkbox"/> WAN-3 <input type="checkbox"/> WAN-4 <input type="checkbox"/> ASY Binary Mode ▾ 2.4G : <input type="checkbox"/> VAP-1 <input type="checkbox"/> VAP-2 <input type="checkbox"/> VAP-3 <input type="checkbox"/> VAP-4 <input type="checkbox"/> VAP-5 <input type="checkbox"/> VAP-6 <input type="checkbox"/> VAP-7 <input type="checkbox"/> VAP-8 5G : <input type="checkbox"/> VAP-1 <input type="checkbox"/> VAP-2 <input type="checkbox"/> VAP-3 <input type="checkbox"/> VAP-4 <input type="checkbox"/> VAP-5 <input type="checkbox"/> VAP-6 <input type="checkbox"/> VAP-7 <input type="checkbox"/> VAP-8

Configuration		
Item	Value setting	Description
Packet Analyzer	The box is unchecked by default.	Check Enable box to activate the Packet Analyzer function. If you cannot enable the checkbox, please check if the storage is available or not. Plug in the USB storage and then enable the Package Analyzer function.
File Name	1. An optional setting 2. Blank is set by default, and the default file name is <Interface>_<Date>_<index> .	Enter the file name to save the captured packets in log storage. If Split Files option is also enabled, the file name will be appended with an index code " _<index> ". The extension file name is .pcap .
Split Files	1. An optional setting 2. The default value of File Size is 200 KB.	Check enable box to split file whenever log file reaching the specified limit. If the Split Files option is enabled, you can further specify the File Size and Unit for the split files. Value Range: 10 ~ 99999. NOTE: File Size cannot be less than 10 KB
Packet Interfaces	An optional setting	Define the interface(s) that Packet Analyzer should work on. At least, one interface is required, but multiple selections are also accepted. The supported interfaces can be: <ul style="list-style-type: none"> ● WAN: When the WAN is enabled at Physical Interface, it can be selected here. ● ASY: This means the serial communication interface. It is used to capture packets appearing in the Field Communication.

4G IIoT RTU

		Therefore, it can only be selected when specific field communication protocol, like Modbus, is enabled. Select Binary mode or String mode for the serial interface.
		<ul style="list-style-type: none"> ● VAP: This means the virtual AP. When WiFi and VAP are enabled, it can be selected here.
Save	N/A	Click the Save button to save the configuration.
Undo	N/A	Click the Undo button to restore what you just configured back to the previous setting.

Once you enabled the Packet Analyzer function on specific Interface(s), you can further specify some filter rules to capture the packets which matched the rules.

Item	Setting
Filter	<input type="checkbox"/> Enable
Source MACs	<input type="text"/>
Source IPs	<input type="text"/>
Source Ports	<input type="text"/>
Destination MACs	<input type="text"/>
Destination IPs	<input type="text"/>
Destination Ports	<input type="text"/>

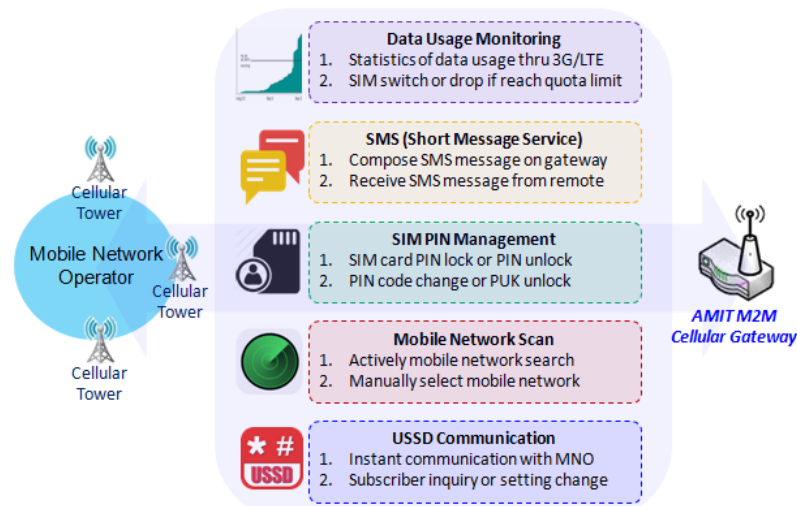

Capture Filters		
Item	Value setting	Description
Filter	Optional setting	Check Enable box to activate the Capture Filter function.
Source MACs	Optional setting	Define the filter rule with Source MACs , which means the source MAC address of packets. Packets which match the rule will be captured. Up to 10 MACs are supported, but they must be separated with “;”, e.g. AA:BB:CC:DD:EE:FF; 11:22:33:44:55:66 The packets will be captured when match any one MAC in the rule.
Source IPs	Optional setting	Define the filter rule with Source IPs , which means the source IP address of packets.

4G IIoT RTU

		<p>Packets which match the rule will be captured. Up to 10 IPs are supported, but they must be separated with “;”, e.g. 192.168.1.1; 192.168.1.2 The packets will be captured when match any one IP in the rule.</p>
Source Ports	Optional setting	<p>Define the filter rule with Source Ports, which means the source port of packets. The packets will be captured when match any port in the rule. Up to 10 ports are supported, but they must be separated with “;”, e.g. 80; 53 Value Range: 1 ~ 65535.</p>
Destination MACs	Optional setting	<p>Define the filter rule with Destination MACs, which means the destination MAC address of packets. Packets which match the rule will be captured. Up to 10 MACs are supported, but they must be separated with “;”, e.g. AA:BB:CC:DD:EE:FF; 11:22:33:44:55:66 The packets will be captured when match any one MAC in the rule.</p>
Destination IPs	Optional setting	<p>Define the filter rule with Destination IPs, which means the destination IP address of packets. Packets which match the rule will be captured. Up to 10 IPs are supported, but they must be separated with “;”, e.g. 192.168.1.1; 192.168.1.2 The packets will be captured when match any one IP in the rule.</p>
Destination Ports	Optional setting	<p>Define the filter rule with Destination Ports, which means the destination port of packets. The packets will be captured when match any port in the rule. Up to 10 ports are supported, but they must be separated with “;”, e.g. 80; 53 Value Range: 1 ~ 65535.</p>

Chapter 7 Service

7.1 Cellular Toolkit

Besides cellular data connection, you may also like to monitor data usage of cellular WAN, sending text message through SMS, changing PIN code of SIM card, communicating with carrier/ISP by USSD command, or doing a cellular network scan for diagnostic purpose.

In Cellular Toolkit section, it includes several useful features that are related to cellular configuration or application. You can configure settings of Data Usage, SMS, SIM PIN, USSD, and Network Scan here. Please note at least a valid SIM card is required to be

inserted to device before you continue settings in this section.

4G IIoT RTU

7.1.1 Data Usage

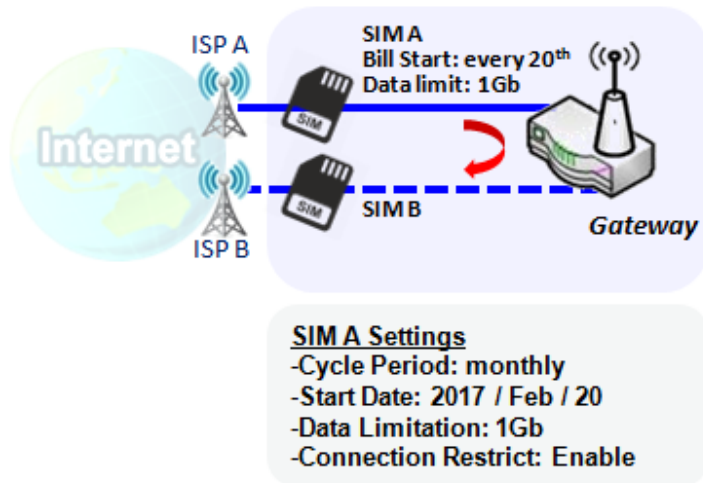

Most of data plan for cellular connection is with a limited amount of data usage. If data usage has been over limited quota, either you will get much lower data throughput that may affect your daily operation, or you will get a 'bill shock' in the next month because carrier/ISP charges a lot for the over-quota data usage.

With help from Data Usage feature, device will monitor cellular data usage continuously and take actions. If data usage reaches limited quota, device can be set to drop the cellular data connection right away. Otherwise, if secondary SIM card is inserted, device will switch to secondary SIM and establish another cellular data connection with secondary SIM automatically.

If Data Usage feature is enabled, all history of cellular data usage can be viewed at **Status > Statistics & Reports > Cellular Usage** tab.

ID	SIM info	Carrier Name	Cycle Period	Start Date	Data Limitation	Connection Restrict	Enable	Action
1	3G/4G SIM A	ISP A	1 Monthly	Mon Apr 01 2019 00:00:00 GMT+0800	1GB	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="button" value="Edit"/> <input type="checkbox"/> Select

3G/4G Data Usage

Data Usage feature enabling gateway device to continuously monitor cellular data usage and take actions. In the diagram, quota limit of SIM A is **1Gb** per month and bill start date is **20th** of every month. The device is smart to start a new calculation of data usage on every 20th of month. Enable Connection Restrict will force gateway device to drop cellular connection of SIM A when data usage reaches quota limit (1Gb in this case). If SIM failover feature is configured in **Internet Setup**, then gateway will switch to SIM B and establish a new cellular data connection automatically.

4G IIoT RTU

Data Usage Setting

Go to **Service > Cellular Toolkit > Data Usage** tab.

Before finished settings for Data Usage, you need to know bill start date, bill period, and quota limit of data usage according to your data plan. You can ask this information from your carrier or ISP.

Create / Edit 3G/4G Data Usage Profile

3G/4G Data Usage Profile List Add Delete								
ID	SIM info	Carrier Name	Cycle Period	Start Date	Data Limitation	Connection Restrict	Enable	Action

When **Add** button is applied, 3G/4G Data Usage Profile Configuration screen will appear. You can create up to four data usage profiles, one profile for each SIM card used in the Gateway.

3G/4G Data Usage Profile Configuration	
Item	Setting
▶ SIM Select	3G/4G ▼ SIM A ▼
▶ Carrier Name	<input type="text"/>
▶ Cycle Period	Days ▼ <input type="text"/>
▶ Start Date	2019 ▼ / April ▼ / 1 ▼
▶ Data Limitation	<input type="text"/> KB ▼
▶ Connection Restrict	<input type="checkbox"/> Enable
▶ Enable	<input checked="" type="checkbox"/> Enable

3G/4G Data Usage Profile Configuration		
Item	Setting	Description
SIM Select	3G/4G-1 and SIM A by default.	Choose a cellular interface (3G/4G-1 or 3G/4G-2), and a SIM card bound to the selected cellular interface to configure its data usage profile. Note: 3G/4G-2 is only available for for the product with dual cellular module.
Carrier Name	It is an optional item.	Fill in the Carrier Name for the selected SIM card for identification.
Cycle Period	Days by default	The first box has three types for cycle period. They are Days , Weekly and Monthly . Days: For per Days cycle periods, you have to further specify the number of days in the second box. Value Range: 1 ~ 90 days. Weekly, Monthly: The cycle period is one week or one month.
Start Date	N/A	Specify the date to start measure network traffic. Please don't select the day before now, otherwise, the traffic statistics will be incorrect.
Data Limitation	N/A	Specify the allowable data limitation for the defined cycle period.

4G IIoT RTU

Connection Restrict	Un-Checked by default.	Check the Enable box to activate the connection restriction function. During the specified cycle period, if the actual data usage exceeds the allowable data limitation, the cellular connection will be forced to disconnect.
Enable	Un-Checked by default.	Check the Enable box to activate the data usage profile.

4G IIoT RTU

7.1.2 SMS

Short Message Service (SMS) is a text messaging service, which is used to be widely-used on mobile phones. It uses standardized communications protocols to allow mobile phones or cellular devices to exchange short text messages in an instant and convenient way.

SMS Setting

Go to **Service > Cellular Toolkit > SMS** tab

With this gateway device, you can send SMS text messages or browse received SMS messages as you usually do on a cellular phone.

Setup SMS Configuration

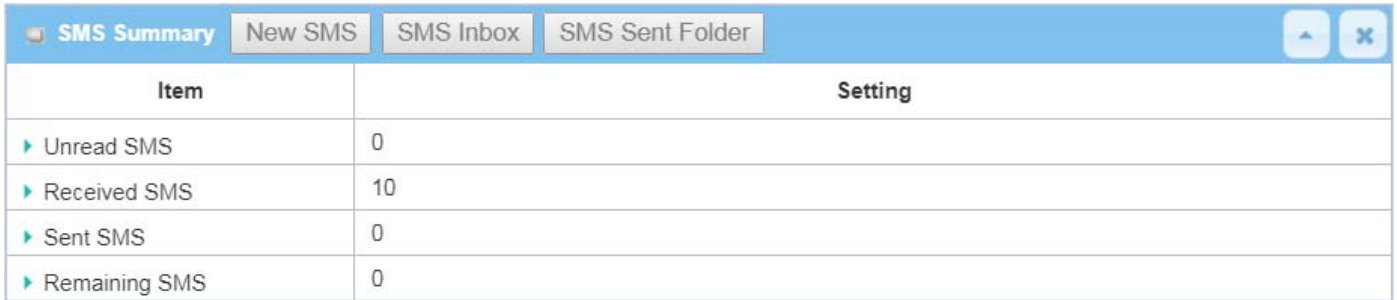

Item	Setting
Physical Interface	3G/4G-1 ▼
SMS	<input type="checkbox"/> Enable SIM Status: SIM_A
SMS Storage	SIM Card Only ▼
SMS Space	<input type="checkbox"/> Enable & Keep Available Space <input type="text" value=""/> (1-10)

Configuration Item	Value setting	Description
Physical Interface	The box is 3G/4G-1 by default	Choose a cellular interface (3G/4G-1 or 3G/4G-2) for the following SMS function configuration. Note: 3G/4G-2 is only available for for the product with dual cellular module.
SMS	The box is checked by default	This is the SMS switch. If the box checked that the SMS function enable, if the box unchecked that the SMS function disable.
SIM Status	N/A	Depend on currently SIM status. The possible value will be SIM_A or SIM_B .
SMS Storage	The box is SIM Card Only by default	This is the SMS storage location. Currently the option only SIM Card Only .
SMS Space	The box is unchecked by default	Check the Enable box and specify a number (1-10) for message count to reserve some available storage space and prevent it from run out of storage. The oldest message(s) will be deleted when the SMS storage is going to full.
Save	N/A	Click the Save button to save the settings

7.1.3 SIM PIN

With most cases in the world, users need to insert a SIM card (a.k.a. UICC) into end devices to get on cellular network for voice service or data surfing. The SIM card is usually released by mobile operators or service providers. Each SIM card has a unique number (so-called ICCID) for network owners or service providers to identify each subscriber. As SIM card plays an important role between service providers and subscribers, some security mechanisms are required on SIM card to prevent any unauthorized access.

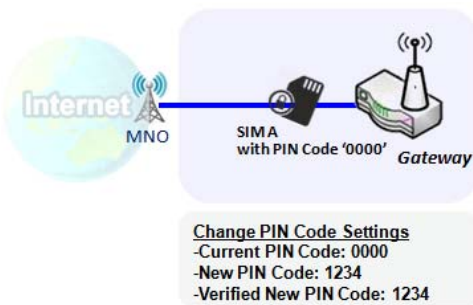

Enabling a PIN code in SIM card is an easy and effective way of protecting cellular devices from unauthorized access. This gateway device allows you to activate and manage PIN code on a SIM card through its web GUI.

Activate PIN code on SIM Card

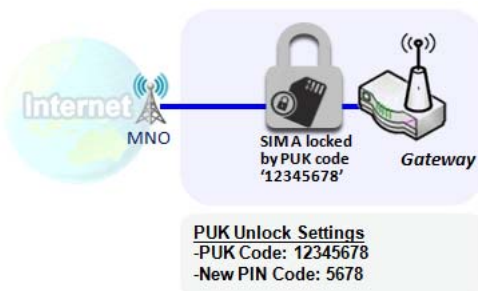

This gateway device allows you to activate PIN code on SIM card. This example shows how to activate PIN code on SIM-A for 3G/4G-1 with default PIN code “0000”.

Change PIN code on SIM Card

This gateway device allows you to change PIN code on SIM card. Following the example above, you need to type original PIN code “0000”, and then type new PIN code with ‘1234’ if you like to set new PIN code as ‘1234’. To confirm the new PIN code you type is what you want, you need to type new PIN code ‘1234’ in Verified New PIN Code again.

Unlock SIM card by PUK Code

If you entered incorrect PIN code at configuration page for 3G/4G-1 WAN over three times, and then it will cause SIM card to be locked by PUK code. Then you have to call service number to get a PUK code to unlock SIM card. In the diagram, the PUK code is “12345678” and new PIN code is “5678”.

4G IIoT RTU

SIM PIN Setting

Go to **Service > Cellular Toolkit > SIM PIN** Tab

With the SIM PIN Function window, it allows you to enable or disable SIM lock (which means protected by PIN code), or change PIN code. You can also see the information of remaining times of failure trials as we mentioned earlier. If you run out of these failure trials, you need to get a PUK code to unlock SIM card.

Select a SIM Card

Item	Setting
▶ Physical Interface	3G/4G-1 ▼
▶ SIM Status	SIM-A Ready
▶ SIM Selection	SIM-A ▼ <input type="button" value="Switch"/>

Configuration Window		
Item	Value setting	Description
Physical Interface	The box is 3G/4G-1 by default	Choose a cellular interface (3G/4G-1 or 3G/4G-2) to change the SIM PIN setting for the selected SIM Card. Note: 3G/4G-2 is only available for the product with dual cellular module.
SIM Status	N/A	Indication for the selected SIM card and the SIM card status. The status could be Ready , Not Insert , or SIM PIN . Ready -- SIM card is inserted and ready to use. It can be a SIM card without PIN protection or that SIM card is already unlocked by correct PIN code. Not Insert -- No SIM card is inserted in that SIM slot. SIM PIN -- SIM card is protected by PIN code, and it's not unlocked by a correct PIN code yet. That SIM card is still at locked status.
SIM Selection	N/A	Select the SIM card for further SIM PIN configuration. Press the Switch button, then the Gateway will switch SIM card to another one. After that, you can configure the SIM card.

4G IIoT RTU

Enable / Change PIN Code

Enable or Disable PIN code (password) function, and even change PIN code function.

SIM function	
<input type="button" value="Save"/> <input type="button" value="Change PIN Code"/>	
Item	Setting
▶ PIN Lock	<input checked="" type="checkbox"/> Enable PIN Code: <input type="text"/> (4~8 digits)
▶ Remaining times	N/A

SIM function Window		
Item Setting	Value setting	Description
SIM lock	Depend on SIM card	Click the Enable button to activate the SIM lock function. For the first time you want to enable the SIM lock function, you have to fill in the PIN code as well, and then click Save button to apply the setting.
Remaining times	Depend on SIM card	Represent the remaining trial times for the SIM PIN unlocking.
Save	N/A	Click the Save button to apply the setting.
Change PIN Code	N/A	Click the Change PIN code button to change the PIN code (password). If the SIM Lock function is not enabled, the Change PIN code button is disabled. In the case, if you still want to change the PIN code, you have to enable the SIM Lock function first, fill in the PIN code, and then click the Save button to enable. After that, You can click the Change PIN code button to change the PIN code.

When **Change PIN Code** button is clicked, the following screen will appear.

Item	Setting
▶ Current PIN Code	<input type="text"/> (4~8 digits)
▶ New PIN Code	<input type="text"/> (4~8 digits)
▶ Verified New PIN Code	<input type="text"/> (4~8 digits)

Item	Value Setting	Description
Current PIN Code	A Must filled setting	Fill in the current (old) PIN code of the SIM card.
New PIN Code	A Must filled setting	Fill in the new PIN Code you want to change.
Verified New PIN Code	A Must filled setting	Confirm the new PIN Code again.
Apply	N/A	Click the Apply button to change the PIN code with specified new PIN code.
Cancel	N/A	Click the Cancel button to cancel the changes and keep current PIN code.

Note: If you changed the PIN code for a certain SIM card, you must also change the corresponding PIN code specified in the **Basic Network > WAN & Uplink > Internet Setup > Connection with SIM Card** page.

4G IIoT RTU

Otherwise, it may result in wrong SIM PIN trials with invalid (old) PIN code.

Unlock with a PUK Code

The PUK Function window is only available for configuration if that SIM card is locked by PUK code. It means that SIM card is locked and needs additional PUK code to unlock. Usually it happens after too many trials of incorrect PIN code, and the remaining times in SIM Function table turns to 0. In this situation, you need to contact your service provider and request a PUK code for your SIM card, and try to unlock the locked SIM card with the provided PUK code. After unlocking a SIM card by PUK code successfully, the SIM lock function will be activated automatically.

Item	Setting
▶ PUK status	PUK unlock.
▶ Remaining times	N/A
▶ PUK Code	<input type="text"/> (8 digits)
▶ New PIN Code	<input type="text"/> (4~8 digits)

PUK Function Window		
Item	Value setting	Description
PUK status	PUK Unlock / PUK Lock	Indication for the PUK status. The status could be PUK Lock or PUK Unlock . As mentioned earlier, the SIM card will be locked by PUK code after too many trials of failure PIN code. In this case, the PUK Status will turns to PUK Lock . In a normal situation, it will display PUK Unlock .
Remaining times	Depend on SIM card	Represent the remaining trial times for the PUK unlocking. Note : DO NOT make the remaining times down to zero, it will damage the SIM card FOREVER ! Call for your ISP's help to get a correct PUK and unlock the SIM if you don't have the PUK code.
PUK Code	A Must filled setting	Fill in the PUK code (8 digits) that can unlock the SIM card in PUK unlock status.
New PIN Code	A Must filled setting	Fill in the New PIN Code (4~8 digits) for the SIM card. You have to determine your new PIN code to replace the old, forgotten one. Keep the PIN code (password) in mind with care.
Save	N/A	Click the Save button to apply the setting.

Note: If you changed the PUK code and PIN code for a certain SIM card, you must also change the corresponding PIN code specified in the **Basic Network > WAN & Uplink > Internet Setup > Connection with SIM Card** page. Otherwise, it may result in wrong SIM PIN trials with invalid (old) PIN code.

4G IIoT RTU

7.1.4 USSD

Unstructured Supplementary Service Data (USSD) is a protocol used by GSM cellular telephones to communicate with the service provider's computers. USSD can be used for WAP browsing, prepaid callback service, mobile-money services, location-based content services, menu-based information services, and as part of configuring the phone on the network.

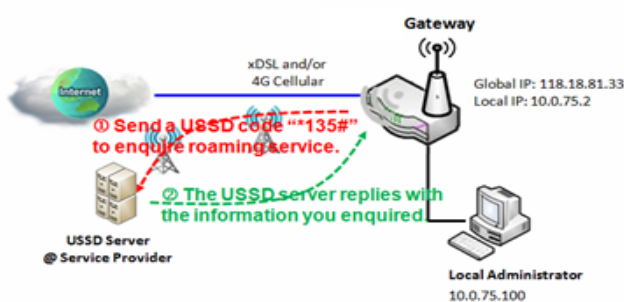

An USSD message is up to 182 alphanumeric characters in length. Unlike Short Message Service (SMS) messages, USSD messages create a real-time connection during an USSD session. The connection remains open, allowing a two-way exchange of a sequence of data. This makes USSD more responsive than services that use SMS.

Configuration

Item	Setting
USSD Profile	--- Option ---
USSD Command	

USSD Scenario

USSD allows you to have an instant bi-directional communication with carrier/ISP. In the diagram, the USSD command ***135#** is referred to data roaming services. After sending that USSD command to carrier, you can get a response at window USSD Response. Please note the USSD command varies for different carriers/ISP.

4G IIoT RTU

USSD Setting

Go to **Service > Cellular Toolkit > USSD** tab.

In "USSD" page, there are four windows for the USSD function. The "Configuration" window can let you specify which 3G/4G module (physical interface) is used for the USSD function, and system will show which SIM card in the module is the current used one. The second window is the "USSD Profile List" and it shows all your defined USSD profiles that store pre-commands for activating an USSD session. An "Add" button in the window can let you add one new USSD profile and define the command for the profile in the third window, the "USSD Profile Configuration". When you want to start the activation of an USSD connection session to the USSD server, select the USSD profile or type in the correct pre-command, and then click on the "Send" button for the session. The responses from the USSD server will be displayed beneath the "USSD Command" line. When commands typed in the "USSD Command" field are sent, received responses will be displayed in the "USSD Response" blank space. User can communicate with the USSD server by sending USSD commands and getting USSD responses via the gateway.

USSD Configuration

Item	Setting
Physical Interface	3G/4G-1 SIM Status: SIM_A

Configuration Item	Value setting	Description
Physical Interface	The box is 3G/4G-1 by default.	Choose a cellular interface (3G/4G-1 or 3G/4G-2) to configure the USSD setting for the connected cellular service (identified with SIM_A or SIM_B). Note: 3G/4G-2 is only available for for the product with dual cellular module.
SIM Status	N/A	Show the connected cellular service (identified with SIM_A or SIM_B).

Create / Edit USSD Profile

The cellular gateway allows you to custom your USSD profile. It supports up to a maximum of 35 USSD profiles.

USSD Command	N/A	The USSD Command string of the selected profile will be shown here.
USSD Response	N/A	Click the Send button to send the USSD command, and the USSD Response screen will appear. You will see the response message of the corresponding service, receive the service SMS.

4G IIoT RTU

7.1.5 Network Scan

"Network Scan" function can let administrator specify the device how to connect to the mobile system for data communication in each 3G/4G interface. For example, administrator can specify which generation of mobile system is used for connection, 2G, 3G or LTE. Moreover, he can define their connection sequence for the gateway device to connect to the mobile system automatically. Administrator also can scan the mobile systems in the air manually, select the target operator system and apply it. The manual scanning approach is used for problem diagnosis.

Network Scan Setting

Go to **Service > Cellular Toolkit > Network Scan** tab.

In "Network Scan" page, there are two windows for the Network Scan function. The "Configuration" window can let you select which 3G/4G module (physical interface) is used to perform Network Scan, and system will show the current used SIM card in the module. You can configure each 3G/4G WAN interface by executing the network scanning one after another. You can also specify the connection sequence of the targeted generation of mobile system, 2G/3G/LTE.

Network Scan Configuration

Configuration	
Item	Setting
▶ Physical Interface	3G/4G-1 ▼ SIM Status: SIM_A
▶ Network Type	LTE Only ▼
▶ Scan Approach	Auto ▼

Configuration		
Item	Value setting	Description
Physical Interface	The box is 3G/4G-1 by default	Choose a cellular interface (3G/4G-1 or 3G/4G-2) for the network scan function. Note: 3G/4G-2 is only available for for the product with dual cellular module.
SIM Status	N/A	Show the connected cellular service (identified with SIM_A or SIM_B).
Network Type	Auto is selected by default.	Specify the network type for the network scan function. It can be Auto, 2G Only, 2G prefer, 3G Only, 3G prefer, or LTE Only. When Auto is selected, the network will be register automatically; If the prefer option is selected, network will be register for your option first; If the only option is selected, network will be register for your option only.
Scan Approach	Auto is selected by default.	When Auto selected, cellular module register automatically. If the Manually option is selected, a Network Provider List screen appears. Press Scan button to scan for the nearest base stations. Select (check the box) the preferred base stations then click Apply button to apply settings.

4G IIoT RTU

Save	N/A	Click Save to save the settings

4G IIoT RTU

7.2 SMS & Event

SMS & Event handling is the application that allows administrator to setup the pre-defined events, handlers, or response behavior with individual profiles. With properly configuring the event handling function, administrator can easily and remotely obtain the status and information via the purchased gateway. Moreover, he can also handle and manage some important system related functions, even the field bus devices and D/O devices which are already well connected to.

The supported events are categorized into two groups: the **managing events** and **notifying events**.

The **managing events** are the events that are used to manage the gateway or change the setting / status of the specific functionality of the gateway. On receiving the managing event, the gateway will take action to change the functionality, collect the required status for administration, and also change the status of a certain connected field bus device simultaneously.

The **notifying events** are the events that some related objects have been triggered and take corresponding actions on the occurrence of the events. It could be an event generated from the connected sensor, or a certain connected field bus device for alerting the administrator something happened with SMS message, Email, and SNMP Trap, etc...

For ease of configuration, administrator can create and edit the common pre-defined managing / notifying event profiles for taking instant reaction on a certain event or managing the devices for some advanced useful purposes. For example, sending/receiving remote managing SMS for the gateway's routine maintaining, the

4G IIoT RTU

field bus device status monitoring, digital sensors detection controlling, and so on. All of such management and notification function can be realized effectively via the Event Handling feature.

The following is the summary lists for the provided profiles, and events:

(Note: The available profiles and events could be different for the purchased product.)

- Profiles (Rules):
 - SMS Configuration and Accounts
 - Email Accounts
 - Digital Input (DI) profiles
 - Digital Output (DO) profiles
 - Modbus Managing Event profiles
 - Modbus Notifying Event profiles
 - Remote Host profiles
 - MQTT Publish Message profiles

- Managing Events:
 - Trigger Type: SMS, SNMP Trap, and Digital Input (DI).
 - Actions: Get the Network Status; or Configure the LAN/VLAN behavior, WIFI behavior, NAT behavior, Firewall behavior, VPN behavior, System Management, Administration, Digital Output behavior, connected Modbus devices, Remote Host, and MQTT Publish Message.

- Notifying Events:
 - Trigger Type: Digital Input, Power Change, Connection Change (WAN, LAN & VLAN, WiFi, DDNS), Administration, Modbus, and Data Usage.
 - Actions: Notify the administrator with SMS, Syslog, SNMP Trap or Email Alert; Change the status of connected Digital Output or Modbus devices; Sending collected information to Remote Host; and Publishing MQTT Message to a designaged MQTT Broker.

To use the event handling function, First of all, you have to enable the event management setting and configure the event details with the provided profile settings. You can create or edit pre-defined profiles for individual managing / notifying events. The profile settings are separated into several items; they are the SMS Account Definition, Email Service Definition, Digital Input (DI) Profile Configuration, Digital Output (DO) Profile Configuration, Modbus Definition, Remote Host Configuration, and MQTT Publish Message.

Then, you have to configure each managing / notifying event with identifying the event's trigger condition, and the corresponding actions (reaction for the event) for the event. For each event, more than one action can be activated simultaneously.

4G IIoT RTU

7.2.1 Configuration

Go to **Service > SMS & Event > Configuration** Tab.

Event handling is the service that allows administrator to setup the pre-defined events, handlers, or response behavior with individual profiles.

Enable Event Management

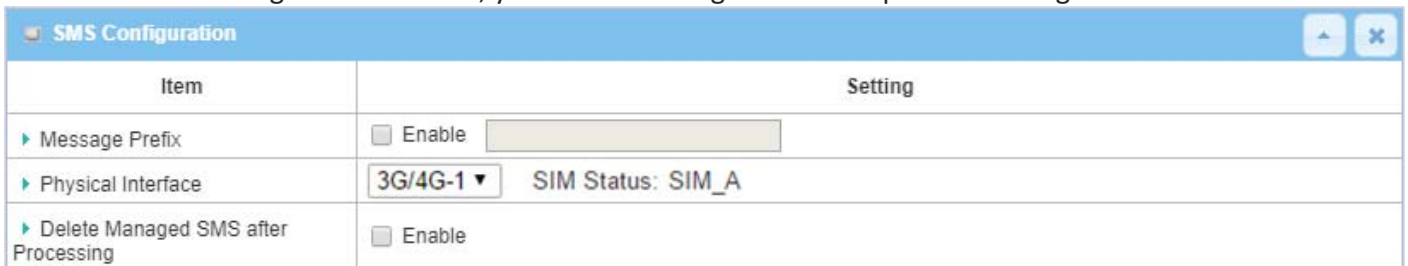

The screenshot shows a configuration window titled "Configuration" with a blue header and window controls. It contains a table with two columns: "Item" and "Setting".

Item	Setting
▶ Event Management	<input type="checkbox"/> Enable

Item	Value setting	Description
Event Management	The box is unchecked by default	Check the Enable box to activate the Event Management function.

Enable SMS Management

To use the SMS management function, you have to configure some important settings first.

The screenshot shows an "SMS Configuration" window with a blue header and window controls. It contains a table with two columns: "Item" and "Setting".

Item	Setting
▶ Message Prefix	<input type="checkbox"/> Enable <input type="text"/>
▶ Physical Interface	<input type="text" value="3G/4G-1"/> SIM Status: SIM_A
▶ Delete Managed SMS after Processing	<input type="checkbox"/> Enable

Item	Value setting	Description
Message Prefix	The box is unchecked by default	Click the Enable box to enable the SMS prefix for validating the received SMS. Once the function is enabled, you have to enter the prefix behind the checkbox. The received managing events SMS must have the designated prefix as an initial identifier, then corresponding handlers will become effective for further processing.
Physical Interface	The box is 3G/4G-1 by default.	Choose a cellular interface (3G/4G-1 or 3G/4G-2) to configure the SMS management setting.

4G IIoT RTU

Note: 3G/4G-2 is only available for for the product with dual cellular module.

SIM Status	N/A	Show the connected cellular service (identified with SIM_A or SIM_B).
Delete Managed SMS after Processing	The box is unchecked by default	Check the Enable box to delete the received managing event SMS after it has been processed.

Create / Edit SMS Account

Setup the SMS Account for managing the gateway through the SMS. It supports up to a maximum of 5 accounts.

SMS Account List Add Delete

Write Function	Write Single Registers by default	Specify the Write Function for Managing Events .
Modbus Mode	Serial by default	Specify the Modbus Mode. It could be Serial or TCP .
IP	1. NA for Serial on Modbus Mode. 2. A Must filled setting for TCP on Modbus Mode.	Specify the IP for TCP on Modbus Mode. IPv4 Format.
Port	1. NA for Serial on Modbus Mode. 2. A Must filled setting for TCP on Modbus Mode.	Specify the Port for TCP on Modbus Mode. Value Range: 1 ~ 65535.
Device ID	1. Numeric String format 2. A Must filled setting	Specify the Device ID of the modbus device. Value Range: 1 ~ 247.
Register	1. Numeric String format 2. A Must filled setting	Specify the Register number of the modbus device. Value Range: 0 ~ 65535.
Value	1. Numeric String format 2. A Must filled setting	Specify the Value. Value Range: 0 ~ 65535.
Enable	The box is unchecked by default.	Click Enable box to activate this profile setting.
Save	NA	Click the Save button to save the configuration
Undo	NA	Click the Undo button to restore what you just configured back to the previous setting.

Create / Edit Remote Host Profile

Setup the Remote Host Profile. It supports up to a maximum of 10 profiles.

ID	Host Name	Host IP	Protocol Type	Port Number	Prefix Message	Suffix Message	Enable	Actions
----	-----------	---------	---------------	-------------	----------------	----------------	--------	---------

You can click the **Add / Edit** button to configure the profile.

Item	Setting
▶ Host Name	<input type="text"/>
▶ Host IP	<input type="text"/>
▶ Protocol Type	TCP ▼
▶ Port Number	<input type="text"/>
▶ Prefix Message	<input type="text"/>
▶ Suffix Message	<input type="text"/>
▶ Enable	<input type="checkbox"/>

4G IIoT RTU

Remote Host Configuration		
Item	Value setting	Description
Host Name	1. String format 2. A Must filled setting	Specify the Remote Host profile name. <i>Value Range:</i> -1 ~ 64 characters.
Host IP	1. A Must filled setting 2. IP Address format.	Specify the IP address for the Remote Host. IPv4 Format.
Protocol Type	1. A Must filled setting 2. TCP is selected by default	Specify the protocol to access the Remote Host. It could be TCP or UDP .
Port Number	1. A Must filled setting	Specify the Port number for accessing the Remote Host. <i>Value Range:</i> 1 ~ 65535.
Prefix Message	1. String format 2. An Optional filled setting	Specify the Prefix Message string as pre-defined identification for accessing the remote host, if required. <i>Value Range:</i> -1 ~ 64 characters.
Suffix Message	1. String format 2. An Optional filled setting	Specify the Suffix Message string as pre-defined identification for accessing the remote host, if required. <i>Value Range:</i> -1 ~ 64 characters.
Enable	The box is unchecked by default.	Click Enable box to activate this profile setting.
Save	NA	Click the Save button to save the configuration
Undo	NA	Click the Undo button to restore what you just configured back to the previous setting.

4G IIoT RTU

Create / Edit MQTT Publish Message Profile

Setup the MQTT Publish Message Profile. It supports up to a maximum of 2 profiles.

MQTT Publish Message List						Add	Delete		
ID	Connection Name	Topic	QoS	Enable	Action				
1	Broker01	/Device_01/Event_act01	0	<input checked="" type="checkbox"/>	Publish Now	Edit	<input type="checkbox"/>	Select	

You can click the **Add / Edit** button to configure the profile.

When **Add** button is clicked, the configuration page / **Field Communication / Data Interchange / MQTT** will be displayed and please make sure the MQTT Client is enabled for further adding any MQTT Client Connections for the MQTT Publish Message profile.

Refer to the **MQTT** section for how to configure the details of MQTT Client and Publish Message.

MQTT Client Function								
Item	Setting							
MQTT Client	<input checked="" type="checkbox"/> Enable							

MQTT Client List								Add	Delete		
ID	Connection Name	Address	Authentication	Security	Port	Enable	Action				
1	Broker01	1.2.3.4	<input type="checkbox"/>	None	1883	<input checked="" type="checkbox"/>	Subscriptions Received List	Edit	<input type="checkbox"/>	Select	

For the message to be published via Managing Event or Notifying Event, you have to configure the **Message Style** as “Manual” and further specify the message content as well. Besides, leave the **Publish Behavior** (Auto Publish) unchecked. Refer to the example highlighted in the following snapshot.

Publish Message Configuration		Save	Undo				
Item	Setting						
Topic	<input type="text" value="/Device_01/Event_act01"/>						
Topics prefix	<input type="checkbox"/> Enable						
Message Style	Manual						
Message	<input type="text" value="Event_act01 triggered!"/>						
QoS	<input checked="" type="radio"/> 0 (At most once) <input type="radio"/> 1 (At least once) <input type="radio"/> 2 (Exactly once)						
Retained	<input type="checkbox"/> Enable						
Publish Behavior	<input type="checkbox"/> Auto Publish						
Enable	<input checked="" type="checkbox"/>						

4G IIoT RTU

7.2.2 Managing Events

Managing Events allow administrator to define the relationship (rule) among event trigger, handlers and response.

Go to **Service > SMS & Event > Managing Events Tab**.

Enable Managing Events

Configuration	
Item	Setting
▶ Managing Events	<input type="checkbox"/> Enable

Configuration Item	Value setting	Description
Managing Events	The box is unchecked by default	Check the Enable box to activate the Managing Events function.

Create / Edit Managing Event Rules

Setup the Managing Event rules. It supports up to a maximum of 128 rules.

Managing Event List						
ID	Event Name	Event	Trigger Type	Description	Enable	Actions

When **Add** or **Edit** button is applied, the **Managing Event Configuration** screen will appear.

Managing Event Configuration		
Item	Value setting	Description
Event Name	Blank by default	Specify a name or identifier for this managing event rule. Value Range: 0 ~ 64 characters.
Event	None by default	Specify the Event type (SMS , SNMP Trap , or Digital Input) and an event identifier / profile. Up to 3 event conditions can be specified for defining an event, and the event will be triggered when all the conditions hold simultaneously (AND relation). The supported Event types could be: SMS: Select SMS and fill the message in the textbox to as the trigger condition for the event; SNMP: Select SNMP Trap and fill the message in the textbox to specify SNMP Trap Event; Digital Input: Select Digital Input and a DI profile you defined to specify a certain Digital Input Event; <i>Note: The available Event Type could be different for the purchased product.</i>
Trigger Type	Period is selected by default	Specify the type of event trigger, either Period or Once . Period: Select Period and specify a time interval, the event will be repeatedly triggered on every time interval when the specified event condition holds. Once: Select Once and the event will be just triggered just one time when the

4G IIoT RTU

		specified event condition holds.
Interval	0 is set by default	Specify the repeatedly event trigger time interval. <i>Value Range:</i> 0 ~86400 seconds.
Description	String format : any text.	Enter a brief description for the Managing Event.
Action	All box is unchecked by default.	Specify Network Status , or at least one rest action to take when the expected event is triggered. Network Status: Select Network Status Checkbox to get the network status as the action for the event; LAN&VLAN: Select LAN&VLAN Checkbox and the interested sub-items (Port link On/Off), the gateway will change the settings as the action for the event; WiFi: Select WiFi Checkbox and the interested sub-items (WiFi radio On/Off), the gateway will change the settings as the action for the event; NAT: Select NAT Checkbox and the interested sub-items (Virtual Server Rule On/Off, DMZ On/Off), the gateway will change the settings as the action for the event; Firewall: Select Firewall Checkbox and the interested sub-items (Remote Administrator Host ID On/Off), the gateway will change the settings as the action for the event; VPN: Select VPN Checkbox and the interested sub-items (IPSec Tunnel ON/Off, PPTP Client On/Off, L2TP Client On/Off, OpenVPN Client On/Off), the gateway will change the settings as the action for the event; GRE: Select GRE Checkbox and the interested sub-items (GRE Tunnel On/Off), the gateway will change the settings as the action for the event; System Manage: Select System Manage Checkbox and the interested sub-items (WAN SSH Service On/Off, TR-069 On/Off), the gateway will change the settings as the action for the event; Administration: Select Administration Checkbox and the interested sub-items (Backup Config, Restore Config, Reboot, Save Current Setting as Default), the gateway will change the settings as the action for the event; Digital Output: Select Digital Output checkbox and a DO profile you defined as the action for the event; Modbus: Select Modbus checkbox and a Modbus Managing Event profile you defined as the action for the event; Remote Host: Select Remote Host checkbox and a Remote Host profile you defined as the action for the event; MQTT: Select MQTT checkbox and a MQTT Publish Message profile you defined as the action for the event; <i>Note: The available Event Type could be different for the purchased product.</i>
Managing Event	The box is unchecked by default.	Click Enable box to activate this Managing Event setting.
Save	NA	Click the Save button to save the configuration
Undo	NA	Click the Undo button to restore what you just configured back to the previous setting.

4G IIoT RTU

7.2.3 Notifying Events

Go to **Service > SMS & Event > Notifying Events** Tab.

Notifying Events Setting allows administrator to define the relationship (rule) between event trigger and handlers.

Enable Notifying Events

Configuration	
Item	Setting
▶ Notifying Events	<input type="checkbox"/> Enable

Configuration Item	Value setting	Description
Notifying Events	The box is unchecked by default	Check the Enable box to activate the Notifying Events function.

Create / Edit Notifying Event Rules

Setup your Notifying Event rules. It supports up to a maximum of 128 rules.

Notifying Event List								
ID	Event Name	Event	Trigger Type	Description	Action	Time Schedule	Enable	Actions

When **Add** or **Edit** button is applied, the **Notifying Event Configuration** screen will appear.

Notifying Event Configuration	
Item	Setting

Notifying Event Configuration		
Item	Value setting	Description
Event Name	Blank by default	Specify a name or identifier for this notifying event rule. Value Range: 0 ~ 64 characters.
Event	None by default	<p>Specify the Event type and corresponding event configuration. Up to 3 event conditions can be specified for defining an event, and the event will be triggered when all the conditions hold simultaneously (AND relation).</p> <p>The supported Event Type could be:</p> <p>Digital Input: Select Digital Input and a DI profile you defined to specify a certain Digital Input Event;</p> <p>Power Change: Select Power Change and a trigger condition to specify the event on a certain power source.</p> <p>WAN: Select WAN and a trigger condition to specify a certain WAN Event;</p> <p>LAN&VLAN: Select LAN&VLAN and a trigger condition to specify a certain LAN&VLAN Event;</p> <p>WiFi: Select WiFi and a trigger condition to specify a certain WiFi Event;</p> <p>DDNS: Select DDNS and a trigger condition to specify a certain DDNS Event;</p> <p>Administration: Select Administration and a trigger condition to specify a certain Administration Event;</p> <p>Modbus: Select Modbus and a Modbus Notifying Event profile you defined to specify a certain Modbus Event;</p> <p>Data Usage: Select Data Usage, the SIM Card (Cellular Service) and a trigger condition to specify a certain Data Usage Event;</p> <p><i>Note: The available Event Type could be different for the purchased product.</i></p>
Trigger Type	Period is selected by default	<p>Specify the type of event trigger, either Period or Once.</p> <p>Period: Select Period and specify a time interval, the event will be repeatedly triggered on every time interval when the specified event condition holds.</p> <p>Once: Select Once and the event will be just triggered just one time when the specified event condition holds.</p>
Interval	0 is set by default	<p>Specify the repeatedly event trigger time interval.</p> <p>Value Range: 0 ~86400 seconds.</p>

4G IIoT RTU

Description	String format : any text.	Enter a brief description for the Notifying Event.
Delay to Send	Blank by default	Specify a delay time, if required, to send out the notifying event once it had been triggered. <i>Value Range:</i> 0 ~3600 seconds.
Action	All box is unchecked by default.	Specify at least one action to take when the expected event is triggered. Digital Output: Select Digital Output checkbox and a DO profile you defined as the action for the event; SMS: Select SMS , and the gateway will send out a SMS to all the defined SMS accounts as the action for the event; Syslog: Select Syslog and select/unselect the Enable Checkbox to as the action for the event; SNMP Trap: Select SNMP Trap , and the gateway will send out SNMP Trap to the defined SNMP Event Receivers as the action for the event; Email Alert: Select Email Alert , and the gateway will send out an Email to the defined Email accounts as the action for the event; Modbus: Select Modbus and a Modbus Notifying Event profile you defined as the action for the event; Remote Host: Select Remote Host checkbox and a Remote Host profile you defined as the action for the event; MQTT: Select MQTT checkbox and a MQTT Publish Message profile you defined as the action for the event; System: Select Reboot after 30 sec. checkbox as the action for the event; <i>Note: The available Event Type could be different for the purchased product.</i>
Time Schedule	(0) Always is selected by default	Select a time scheduling rule for the Notifying Event.
Notifying Events	The box is unchecked by default.	Click Enable box to activate this Notifying Event setting.
Save	NA	Click the Save button to save the configuration
Undo	NA	Click the Undo button to restore what you just configured back to the previous setting.

Chapter 8 Status

8.1 Dashboard

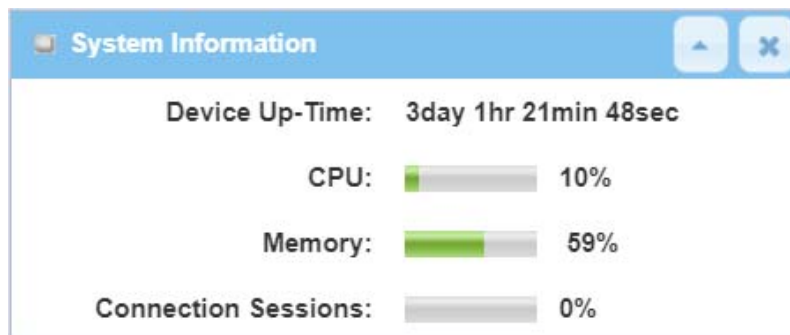

8.1.1 Device Dashboard

The **Device Dashboard** window shows the current status in graph or tables for quickly understanding the operation status for the gateway. They are the System Information, System Information History, and Network Interface Status. The display will be refreshed once per second.

From the menu on the left, select **Status > Dashboard > Device Dashboard** tab.

System Information Status

The **System Information** screen shows the device Up-time and the resource utilization for the CPU, Memory, and Connection Sessions.

4G IIoT RTU

System Information History

The **System Information History** screen shows the statistic graphs for the CPU and memory.

Network Interface Status

The **Network Interface Status** screen shows the statistic information for each network interface of the gateway. The statistic information includes the Interface Type, Upload Traffic, Download Traffic, and Current Upload / Download Traffic.

Device	Type	Upload Traffic	Download Traffic	Current Upload Traffic	Current Download Traffic
eth2	Ethernet	211 (MB)	321 (MB)	3 (KB)	3 (KB)
eth2.1	Ethernet	24 (MB)	71 (KB)	64 (Bytes)	0 (Bytes)
eth2.2	Ethernet	168 (MB)	283 (MB)	3 (KB)	3 (KB)
br0	Ethernet	19 (MB)	31 (MB)	42 (Bytes)	0 (Bytes)
ra0	Wireless LAN	1 (MB)	1 (MB)	0 (Bytes)	0 (Bytes)
rai0	Wireless LAN	21 (MB)	42 (MB)	0 (Bytes)	0 (Bytes)
ra1	Wireless LAN	0 (Bytes)	0 (Bytes)	0 (Bytes)	0 (Bytes)
rai1	Wireless LAN	362 (Bytes)	4 (KB)	0 (Bytes)	0 (Bytes)
tun0	Ethernet	0 (Bytes)	0 (Bytes)	0 (Bytes)	0 (Bytes)

4G IIoT RTU

8.2 Basic Network

8.2.1 WAN & Uplink Status

Go to **Status > Basic Network > WAN & Uplink** tab.

The **WAN & Uplink Status** window shows the current status for different network type, including network configuration, connecting information, modem status and traffic statistics. The display will be refreshed on every five seconds.

WAN interface IPv4 Network Status

WAN interface IPv4 Network Status screen shows status information for IPv4 network.

ID	Interface	WAN Type	Network Type	IP Addr.	Subnet Mask	Gateway	DNS	MAC Address	Conn. Status	Action
WAN-1	3G/4G	3G/4G	NAT	10.59.152.73	255.255.255.252	10.59.152.74	168.95.1.1, 168.95.192.1	N/A	Connected 0 day 0:26:38	Edit

WAN interface IPv4 Network Status		
Item	Value setting	Description
ID	N/A	It displays corresponding WAN interface WAN IDs.
Interface	N/A	It displays the type of WAN physical interface. Depending on the model purchased, it can be Ethernet, 3G/4G, etc...
WAN Type	N/A	It displays the method which public IP address is obtained from your ISP. Depending on the model purchased, it can be Static IP, Dynamic IP, PPPoE, PPTP, L2TP, 3G/4G.
Network Type	N/A	It displays the network type for the WAN interface(s). Depending on the model purchased, it can be NAT, Routing, Bridge, or IP Pass-through.
IP Addr.	N/A	It displays the public IP address obtained from your ISP for Internet connection. Default value is 0.0.0.0 if left unconfigured.
Subnet Mask	N/A	It displays the Subnet Mask for public IP address obtained from your ISP for Internet connection. Default value is 0.0.0.0 if left unconfigured.
Gateway	N/A	It displays the Gateway IP address obtained from your ISP for Internet connection. Default value is 0.0.0.0 if left unconfigured.
DNS	N/A	It displays the IP address of DNS server obtained from your ISP for Internet connection. Default value is 0.0.0.0 if left unconfigured.
MAC Address	N/A	It displays the MAC Address for your ISP to allow you for Internet access. Note: Not all ISP may require this field.
Conn. Status	N/A	It displays the connection status of the device to your ISP. Status are Connected or disconnected.
Action	N/A	This area provides functional buttons.

4G IIoT RTU

Renew button allows user to force the device to request an IP address from the DHCP server. Note: **Renew** button is available when DHCP WAN Type is used and WAN connection is disconnected.

Release button allows user to force the device to clear its IP address setting to disconnect from DHCP server. Note: **Release** button is available when DHCP WAN Type is used and WAN connection is connected.

Connect button allows user to manually connect the device to the Internet. Note: Connect button is available when Connection Control in WAN Type setting is set to Connect Manually (Refer to **Edit** button in **Basic Network > WAN & Uplink > Internet Setup**) and WAN connection status is disconnected.

Disconnect button allows user to manually disconnect the device from the Internet. Note: **Connect** button is available when Connection Control in WAN Type setting is set to Connect Manually (Refer to **Edit** button in **Basic Network > WAN & Uplink > Internet Setup**) and WAN connection status is connected.

WAN interface IPv6 Network Status

WAN interface IPv6 Network Status screen shows status information for IPv6 network.

WAN Interface IPv6 Network Status						
ID	Interface	WAN type	Link-local IP Address	Global IP Address	Conn. Status	Action
WAN-1	3G/4G	IPv6		/64	Disconnected	Edit

WAN interface IPv6 Network Status		
Item	Value setting	Description
ID	N/A	It displays corresponding WAN interface WAN IDs.
Interface	N/A	It displays the type of WAN physical interface. Depending on the model purchased, it can be Ethernet, 3G/4G, etc...
WAN Type	N/A	It displays the method which public IP address is obtained from your ISP. WAN type setting can be changed from Basic Network > IPv6 > Configuration .
Link-local IP Address	N/A	It displays the LAN IPv6 Link-Local address.
Global IP Address	N/A	It displays the IPv6 global IP address assigned by your ISP for your Internet connection.
Conn. Status	N/A	It displays the connection status. The status can be connected, disconnected and connecting.
Action	N/A	This area provides functional buttons. Edit Button when pressed, web-based utility will take you to the IPv6 configuration page. (Basic Network > IPv6 > Configuration .)

4G IIoT RTU

LAN Interface Network Status

LAN Interface Network Status screen shows IPv4 and IPv6 information of LAN network.

LAN Interface Network Status			
IPv4 Address	IPv4 Subnet Mask	MAC Address	Action
192.168.123.254	255.255.255.0	00:50:18:00:0F:FE	<input type="button" value="Edit IPv4"/>

LAN Interface Network Status		
Item	Value setting	Description
IPv4 Address	N/A	It displays the current IPv4 IP Address of the gateway This is also the IP Address user use to access Router's Web-based Utility.
IPv4 Subnet Mask	N/A	It displays the current mask of the subnet.
MAC Address	N/A	It displays the LAN MAC Address of the gateway
Action	N/A	This area provides functional buttons. Edit IPv4 Button when press, web-based utility will take you to the Ethernet LAN configuration page. (Basic Network > LAN & VLAN > Ethernet LAN tab).

4G IIoT RTU

8.2.2 LAN & VLAN Status

Go to **Status > Basic Network > LAN & VLAN** tab.

Client List

The **Client List** shows you the LAN Interface, IP address, Host Name, MAC Address, and Remaining Lease Time of each device that is connected to this gateway.

LAN Client List				
LAN Interface	IP Address	Host Name	MAC Address	Remaining Lease Time
Ethernet	Dynamic / 192.168.66.100	amit25613572	00-13-3B-0E-5B-1D	00:15:00

LAN Client List		
Item	Value setting	Description
LAN Interface	N/A	Client record of LAN Interface. String Format.
IP Address	N/A	Client record of IP Address Type and the IP Address. Type is String Format and the IP Address is IPv4 Format.
Host Name	N/A	Client record of Host Name. String Format.
MAC Address	N/A	Client record of MAC Address. MAC Address Format.
Remaining Lease Time	N/A	Client record of Remaining Lease Time. Time Format.

4G IIoT RTU

8.2.3 WiFi Status

Go to **Status > Basic Network > WiFi** tab.

The **WiFi Status** window shows the overall statistics of WiFi VAP entries.

WiFi Virtual AP List

The WiFi Virtual AP List shows all of the virtual AP information on each WiFi module. The **Edit** button allows for quick configuration changes.

WiFi Module One Virtual AP List									
Op. Band	ID	WiFi Enable	Op. Mode	SSID	Channel	WiFi System	Auth.&Security	MAC Address	Action
2.4G	VAP-1	<input checked="" type="checkbox"/>	WiFi Uplink	Staff_2.4G	1	b/g/n Mixed	WPA2-PSK(AES)	00:50:18:3A:4A:5F	Edit QR Code
2.4G	VAP-2	<input checked="" type="checkbox"/>	WiFi Uplink	default	1	b/g/n Mixed	Open(None)	02:50:18:38:4A:5F	Edit QR Code
2.4G	VAP-3	<input type="checkbox"/>	WiFi Uplink	default	1	b/g/n Mixed	WPA2-PSK(AES)	02:50:18:39:4A:5F	Edit QR Code
2.4G	VAP-4	<input type="checkbox"/>	WiFi Uplink	default	1	b/g/n Mixed	WPA2-PSK(AES)	02:50:18:3A:4A:5F	Edit QR Code
2.4G	VAP-5	<input type="checkbox"/>	WiFi Uplink	default	1	b/g/n Mixed	WPA2-PSK(AES)	02:50:18:3B:4A:5F	Edit QR Code
2.4G	VAP-6	<input type="checkbox"/>	WiFi Uplink	default	1	b/g/n Mixed	WPA2-PSK(AES)	02:50:18:3C:4A:5F	Edit QR Code
2.4G	VAP-7	<input type="checkbox"/>	WiFi Uplink	default	1	b/g/n Mixed	WPA2-PSK(AES)	02:50:18:3D:4A:5F	Edit QR Code

WiFi Virtual AP List		
Item	Value setting	Description
Op. Band	N/A	It displays the Wi-Fi Operation Band (2.4G or 5G) of VAP.
ID	N/A	It displays the ID of VAP.
WiFi Enable	N/A	It displays whether the VAP wireless signal is enabled or disabled.
Op. Mode	N/A	It displays the WiFi Operation Mode of VAP.
SSID	N/A	It displays the network ID of VAP.
Channel	N/A	It displays the wireless channel used.
WiFi System	N/A	The WiFi System of VAP.
Auth. & Security	N/A	It displays the authentication and encryption type used.
MAC Address	N/A	It displays MAC Address of VAP.
Action	N/A	Click the Edit button to make a quick access to the WiFi configuration page. (Basic Network > WiFi > Configuration tab) The QR Code button allow you to generate QR code for quick connect to the VAP by scanning the QR code.

4G IIoT RTU

WiFi IDS Status

The WiFi IDS Status shows all the WIDS statistics on each WiFi module.

WiFi Module One IDS Status								
Authentication Frame	Association Request Frame	Re-association Request Frame	Probe Request Frame	Disassociation Frame	Deauthentication Frame	EAP Request Frame	Malicious Data Frame	Action
0	0	0	0	0	0	0	0	Reset

WiFi IDS Status Item	Value setting	Description
Authentication Frame	N/A	It displays the receiving Authentication Frame count.
Association Request Frame	N/A	It displays the receiving Association Request Frame count.
Re-association Request Frame	N/A	It displays the receiving Re-association Request Frame count.
Probe Request Frame	N/A	It displays the receiving Probe Request Frame count.
Disassociation Frame	N/A	It displays the receiving Disassociation Frame count.
Deauthentication Frame	N/A	It displays the receiving Deauthentication Frame count.
EAP Request Frame	N/A	It displays the receiving EAP Request Frame count.
Malicious Data Frame	N/A	It displays the number of receiving unauthorized wireless packets.
Action	N/A	Click the Reset button to clear the entire statistic and reset counter to 0.

Ensure WIDS function is enabled

Go to **Basic Network > WiFi > Advanced Configuration tab**

Note that the WIDS of **2.4GHz** or **5GHz WiFi** should be configured **separately**.

4G IIoT RTU

WiFi Traffic Statistic

The WiFi Traffic Statistic shows all the received and transmitted packets on each WiFi module.

WiFi Module One Traffic Statistics				
Op. Band	ID	Received Packets	Transmitted Packets	Action
2.4G	VAP-1	269	80	Reset
2.4G	VAP-2	26	8	Reset
2.4G	VAP-3	0	0	Reset
2.4G	VAP-4	0	0	Reset
2.4G	VAP-5	0	0	Reset
2.4G	VAP-6	0	0	Reset
2.4G	VAP-7	0	0	Reset

WiFi Traffic Statistic		
Item	Value setting	Description
Op. Band	N/A	It displays the Wi-Fi Operation Band (2.4G or 5G) of VAP.
ID	N/A	It displays the VAP ID.
Received Packets	N/A	It displays the number of received packets.
Transmitted Packet	N/A	It displays the number of transmitted packets.
Action	N/A	Click the Reset button to clear individual VAP statistics.
Refresh Button	N/A	Click the Refresh button to update the entire VAP Traffic Statistic instantly.

4G IIoT RTU

8.2.4 DDNS Status

Go to **Status > Basic Network > DDNS** tab.

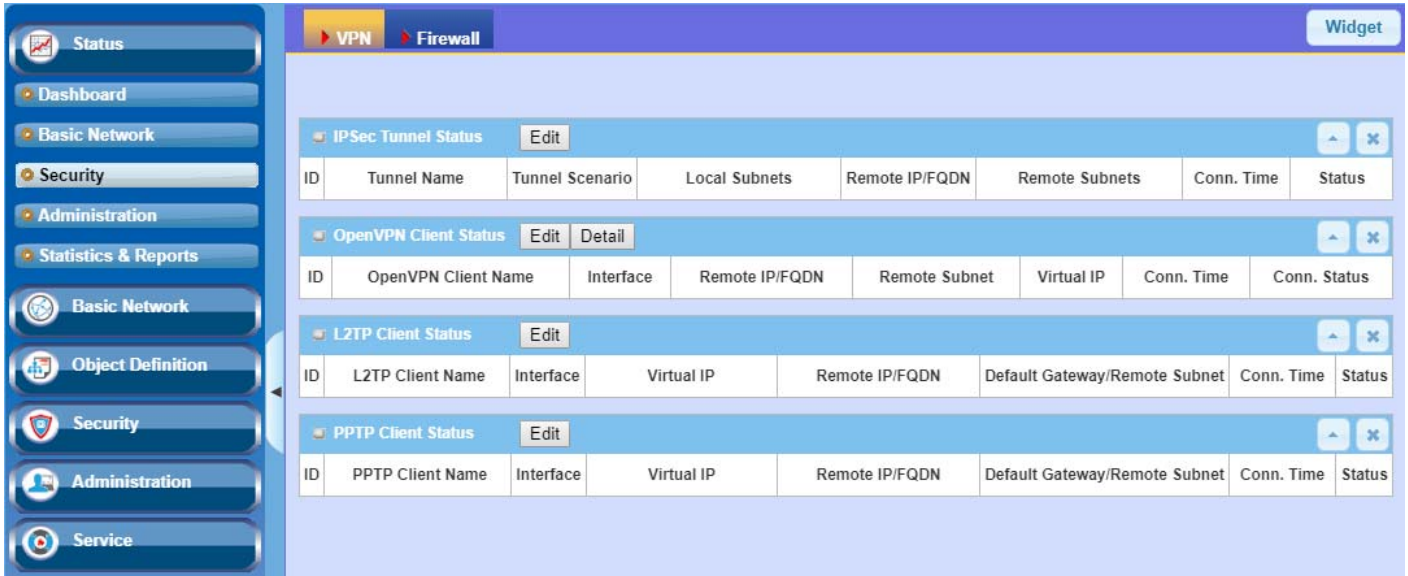

The **DDNS Status** window shows the current DDNS service in use, the last update status, and the last update time to the DDNS service server.

DDNS Status

DDNS Status List				
Host Name	Provider	Effective IP	Last Update Status	Last Update Time

DDNS Status Item	Value Setting	Description
Host Name	N/A	It displays the name you entered to identify DDNS service provider
Provider	N/A	It displays the DDNS server of DDNS service provider
Effective IP	N/A	It displays the public IP address of the device updated to the DDNS server
Last Update Status	N/A	It displays whether the last update of the device public IP address to the DDNS server has been successful (Ok) or failed (Fail).
Last Update Time	N/A	It displays time stamp of the last update of public IP address to the DDNS server.
Refresh	N/A	The refresh button allows user to force the display to refresh information.

8.3 Security

8.3.1 VPN Status

Go to **Status > Security > VPN** tab.

The **VPN Status** window shows the overall VPN tunnel status. The display will be refreshed on every five seconds.

IPSec Tunnel Status

IPSec Tunnel Status windows show the configuration for establishing IPSec VPN connection and current connection status.

ID	Tunnel Name	Tunnel Scenario	Local Subnets	Remote IP/FQDN	Remote Subnets	Conn. Time	Status
----	-------------	-----------------	---------------	----------------	----------------	------------	--------

Item	Value setting	Description
Tunnel Name	N/A	It displays the tunnel name you have entered to identify.
Tunnel Scenario	N/A	It displays the Tunnel Scenario specified.
Local Subnets	N/A	It displays the Local Subnets specified.
Remote IP/FQDN	N/A	It displays the Remote IP/FQDN specified.
Remote Subnets	N/A	It displays the Remote Subnets specified.

4G IIoT RTU

Conn. Time	N/A	It displays the connection time for the IPSec tunnel.
Status	N/A	It displays the Status of the VPN connection. The status displays are Connected, Disconnected, Wait for traffic, and Connecting.
Edit Button	N/A	Click on Edit Button to change IPSec setting, web-based utility will take you to the IPSec configuration page. (Security > VPN > IPSec tab)

OpenVPN Client Status

OpenVPN Client Status							
ID	OpenVPN Client Name	Interface	Remote IP/FQDN	Remote Subnet	Virtual IP	Conn. Time	Conn. Status
OpenVPN Client Status							
Item	Value setting	Description					
OpenVPN Client Name	N/A	It displays the Client name you have entered for identification.					
Interface	N/A	It displays the WAN interface specified for the OpenVPN client connection.					
Remote IP/FQDN	N/A	It displays the peer OpenVPN Server's Public IP address (the WAN IP address) or FQDN.					
Remote Subnet	N/A	It displays the Remote Subnet specified.					
TUN/TAP Read(bytes)	N/A	It displays the TUN/TAP Read Bytes of OpenVPN Client.					
TUN/TAP Write(bytes)	N/A	It displays the TUN/TAP Write Bytes of OpenVPN Client.					
TCP/UDP Read(bytes)	N/A	It displays the TCP/UDP Read Bytes of OpenVPN Client.					
TCP/UDP Write(bytes)	N/A	It displays the TCP/UDP Write Bytes of OpenVPN Client. Connection					
Conn. Time	N/A	It displays the connection time for the corresponding OpenVPN tunnel.					
Conn. Status	N/A	It displays the connection status of the corresponding OpenVPN tunnel. The status can be Connected, or Disconnected.					

L2TP Client Status

L2TP Client Status shows the configuration for establishing L2TP tunnel and current connection status.

L2TP Client Status							
ID	L2TP Client Name	Interface	Virtual IP	Remote IP/FQDN	Default Gateway/Remote Subnet	Conn. Time	Status
L2TP Client Status							
Item	Value setting	Description					
Client Name	N/A	It displays Name for the L2TP Client specified.					
Interface	N/A	It displays the WAN interface with which the gateway will use to request PPTP tunneling connection to the PPTP server.					
Virtual IP	N/A	It displays the IP address assigned by Virtual IP server of L2TP server.					

4G IIoT RTU

Remote IP/FQDN	N/A	It displays the L2TP Server's Public IP address (the WAN IP address) or FQDN.
Default Gateway/Remote Subnet	N/A	It displays the specified IP address of the gateway device used to connect to the internet to connect to the L2TP server –the default gateway. Or other specified subnet if the default gateway is not used to connect to the L2TP server –the remote subnet.
Conn. Time	N/A	It displays the connection time for the L2TP tunnel.
Status	N/A	It displays the Status of the VPN connection. The status displays Connected, Disconnect, and Connecting.
Edit	N/A	Click on Edit Button to change L2TP client setting, web-based utility will take you to the L2TP client page. (Security > VPN > L2TP tab)

PPTP Client Status

PPTP Client Status shows the configuration for establishing PPTP tunnel and current connection status.

ID	PPTP Client Name	Interface	Virtual IP	Remote IP/FQDN	Default Gateway/Remote Subnet	Conn. Time	Status
----	------------------	-----------	------------	----------------	-------------------------------	------------	--------

PPTP Client Status		
Item	Value setting	Description
Client Name	N/A	It displays Name for the PPTP Client specified.
Interface	N/A	It displays the WAN interface with which the gateway will use to request PPTP tunneling connection to the PPTP server.
Virtual IP	N/A	It displays the IP address assigned by Virtual IP server of PPTP server.
Remote IP/FQDN	N/A	It displays the PPTP Server's Public IP address (the WAN IP address) or FQDN.
Default Gateway / Remote Subnet	N/A	It displays the specified IP address of the gateway device used to connect to the internet to connect to the PPTP server –the default gateway. Or other specified subnet if the default gateway is not used to connect to the PPTP server –the remote subnet.
Conn. Time	N/A	It displays the connection time for the PPTP tunnel.
Status	N/A	It displays the Status of the VPN connection. The status displays Connected, Disconnect, and Connecting.
Edit Button	N/A	Click on Edit Button to change PPTP client setting, web-based utility will take you to the PPTP server page. (Security > VPN > PPTP tab)

4G IIoT RTU

8.3.2 Firewall Status

Go to **Status > Security > Firewall Status** Tab.

The **Firewall Status** provides user a quick view of the firewall status and current firewall settings. It also keeps the log history of the dropped packets by the firewall rule policies, and includes the administrator remote login settings specified in the Firewall Options. The display will be refreshed on every five seconds.

By clicking the icon [+], the status table will be expanded to display log history. Clicking the **Edit** button the screen will be switched to the configuration page.

Packet Filter Status

Packet Filters Edit			
Activated Filter Rule	Detected Contents	IP	Time

Packet Filter Status		
Item	Value setting	Description
Activated Filter Rule	N/A	This is the Packet Filter Rule name.
Detected Contents	N/A	This is the logged packet information, including the source IP, destination IP, protocol, and destination port –the TCP or UDP. String format: Source IP to Destination IP : Destination Protocol (TCP or UDP)
IP	N/A	The Source IP (IPv4) of the logged packet.
Time	N/A	The Date and Time stamp of the logged packet. Date & time format. ("Month" "Day" "Hours":"Minutes":"Seconds")

Note: Ensure Packet Filter Log Alert is enabled.

*Refer to **Security > Firewall > Packet Filter** tab. Check Log Alert and save the setting.*

URL Blocking Status

URL Blocking Edit			
Activated Blocking Rule	Blocked URL	IP	Time

URL Blocking Status		
Item	Value setting	Description
Activated Blocking Rule	N/A	This is the URL Blocking Rule name.
Blocked URL	N/A	This is the logged packet information.
IP	N/A	The Source IP (IPv4) of the logged packet.

4G IIoT RTU

Time	N/A	The Date and Time stamp of the logged packet. Date & time format. ("Month" "Day" "Hours":"Minutes":"Seconds")
-------------	-----	---

Note: Ensure URL Blocking Log Alert is enabled.

Refer to **Security > Firewall > URL Blocking** tab. Check Log Alert and save the setting.

Web Content Filter Status

Web Content Filters Edit				
Activated Filter Rule		Detected Contents	IP	Time
Web Content Filter Status				
Item	Value setting	Description		
Activated Filter Rule	N/A	Logged packet of the rule name. String format.		
Detected Contents	N/A	Logged packet of the filter rule. String format.		
IP	N/A	Logged packet of the Source IP. IPv4 format.		
Time	N/A	Logged packet of the Date Time. Date time format ("Month" "Day" "Hours":"Minutes":"Seconds")		

Note: Ensure Web Content Filter Log Alert is enabled.

Refer to **Security > Firewall > Web Content Filter** tab. Check Log Alert and save the setting.

MAC Control Status

MAC Control Edit				
Activated Control Rule		Blocked MAC Addresses	IP	Time
MAC Control Status				
Item	Value setting	Description		
Activated Control Rule	N/A	This is the MAC Control Rule name.		
Blocked MAC Addresses	N/A	This is the MAC address of the logged packet.		
IP	N/A	The Source IP (IPv4) of the logged packet.		
Time	N/A	The Date and Time stamp of the logged packet. Date & time format. ("Month" "Day" "Hours":"Minutes":"Seconds")		

Note: Ensure MAC Control Log Alert is enabled.

Refer to **Security > Firewall > MAC Control** tab. Check Log Alert and save the setting.

4G IIoT RTU

Application Filters Status

Filtered Application Category	Filtered Application Name	IP	Time
Application Filters Status			
Item	Value setting	Description	
Filtered Application Category	N/A	The name of the Application Category being blocked.	
Filtered Application Name	N/A	The name of the Application being blocked.	
IP	N/A	The Source IP (IPv4) of the logged packet.	
Time	N/A	The Date and Time stamp of the logged packet. Date & time format. ("Month" "Day" "Hours":"Minutes":"Seconds")	

Note: Ensure Application Filter Log Alert is enabled.

Refer to **Security > Firewall > Application Filter** tab. Check Log Alert and save the setting.

IPS Status

Detected Intrusion	IP	Time
IPS		
IPS Firewall Status		
Item	Value setting	Description
Detected Intrusion	N/A	This is the intrusion type of the packets being blocked.
IP	N/A	The Source IP (IPv4) of the logged packet.
Time	N/A	The Date and Time stamp of the logged packet. Date & time format. ("Month" "Day" "Hours":"Minutes":"Seconds")

Note: Ensure IPS Log Alert is enabled.

Refer to **Security > Firewall > IPS** tab. Check Log Alert and save the setting.

4G IIoT RTU

Firewall Options Status

Options Edit			
Stealth Mode	SPI	Discard Ping from WAN	Remote Administrator Management
Disable	Disable	Disable	IP: 192.168.121.54, User Name: admin, Time: Apr 1 11:14:54

Item	Value setting	Description
Stealth Mode	N/A	Enable or Disable setting status of Stealth Mode on Firewall Options. String Format: Disable or Enable
SPI	N/A	Enable or Disable setting status of SPI on Firewall Options. String Format : Disable or Enable
Discard Ping from WAN	N/A	Enable or Disable setting status of Discard Ping from WAN on Firewall Options. String Format: Disable or Enable
Remote Administrator Management	N/A	Enable or Disable setting status of Remote Administrator. If Remote Administrator is enabled, it shows the currently logged in administrator's source IP address and login user name and the login time. Format: IP : "Source IP", User Name: "Login User Name", Time: "Date time" Example: IP: 192.168.127.39, User Name: admin, Time: Mar 3 01:34:13

Note: Ensure Firewall Options Log Alert is enabled.

*Refer to **Security > Firewall > Options** tab. Check Log Alert and save the setting.*

4G IIoT RTU

8.4 Administration

8.4.1 Configure & Manage Status

Go to **Status > Administration > Configure & Manage** tab.

The **Configure & Manage Status** window shows the status for managing remote network devices. The type of management available in your device is depended on the device model purchased. The commonly used ones are the SNMP, TR-069, and UPnP. The display will be refreshed on every five seconds.

SNMP Linking Status

SNMP Link Status screen shows the status of current active SNMP connections.

SNMP Linking Status						
User Name	IP Address	Port	Community	Auth. Mode	Privacy Mode	SNMP Version

SNMP Link Status		
Item	Value setting	Description
User Name	N/A	It displays the user name for authentication. This is only available for SNMP version 3.
IP Address	N/A	It displays the IP address of SNMP manager.
Port	N/A	It displays the port number used to maintain connection with the SNMP manager.
Community	N/A	It displays the community for SNMP version 1 or version 2c only.
Auth. Mode	N/A	It displays the authentication method for SNMP version 3 only.
Privacy Mode	N/A	It displays the privacy mode for version 3 only.
SNMP Version	N/A	It displays the SNMP Version employed.

SNMP Trap Information

SNMP Trap Information screen shows the status of current received SNMP traps.

SNMP Trap Information		
Trap Level	Time	Trap Event

SNMP Trap Information		
Item	Value setting	Description
Trap Level	N/A	It displays the trap level.
Time	N/A	It displays the timestamp of trap event.
Trap Event	N/A	It displays the IP address of the trap sender and event type.

4G IIoT RTU

TR-069 Status

TR-069 Status screen shows the current connection status with the TR-068 server.

TR-069 Status	Value setting	Description
Item		
Link Status	N/A	It displays the current connection status with the TR-068 server. The connection status is either On when the device is connected with the TR-068 server or Off when disconnected.

4G IIoT RTU

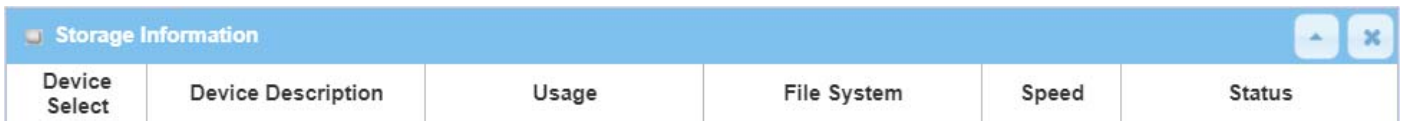

8.4.2 Log Storage Status

Go to **Status > Administration > Log Storage** tab.

The **Log Storage Status** screen shows the status for selected device storage.

Log Storage Status

Log Storage Status screen shows the status of current the selected device storage. The status includes Device Description, Usage, File System, Speed, and status.

Storage Information					
Device Select	Device Description	Usage	File System	Speed	Status

4G IIoT RTU

8.5 Statistics & Report

8.5.1 Connection Session

Go to **Status > Statistics & Reports > Connection Session** tab.

Internet Surfing Statistic shows the connection tracks on this router.

Internet Surfing List (14 entries) Previous Next First Last Export (.xml) Export (.csv)					
Refresh					
User Name	Protocol	Internal IP & Port	MAC	External IP & Port	Duration Time
	UDP	192.168.127.58:3847		88.198.95.100:1194	2019/04/01 12:09~

Internet Surfing Statistic		
Item	Value setting	Description
Previous	N/A	Click the Previous button; you will see the previous page of track list.
Next	N/A	Click the Next button; you will see the next page of track list.
First	N/A	Click the First button; you will see the first page of track list.
Last	N/A	Click the Last button; you will see the last page of track list.
Export (.xml)	N/A	Click the Export (.xml) button to export the list to xml file.
Export (.csv)	N/A	Click the Export (.csv) button to export the list to csv file.
Refresh	N/A	Click the Refresh button to refresh the list.

4G IIoT RTU

8.5.2 Network Traffic (not supported)

Not supported feature for the purchased product, leave it as blank.

4G IIoT RTU

8.5.3 Login Statistics

Go to **Status > Statistics & Reports > Login Statistics**

Login Statistics shows the login information.

Device Manager Login Statistics				
Refresh				
User Name	Protocol Type	IP Address	Info	Duration Time
admin	HTTP	192.168.123.190	Admin	2018/01/01 00:00~
admin	HTTP	192.168.123.190	Admin	2018/01/01 00:02~
admin	HTTP	192.168.123.190	Login Fail	2019/06/05 16:30~
admin	HTTP	192.168.123.190	Admin	2019/06/05 16:30~

Device Manager Login Statistic Item	Value setting	Description
Previous	N/A	Click the Previous button; you will see the previous page of login statistics.
Next	N/A	Click the Next button; you will see the next page of login statistics.
First	N/A	Click the First button; you will see the first page of login statistics.
Last	N/A	Click the Last button; you will see the last page of login statistics.
Export (.xml)	N/A	Click the Export (.xml) button to export the login statistics to xml file.
Export (.csv)	N/A	Click the Export (.csv) button to export the login statistics to csv file.
Refresh	N/A	Click the Refresh button to refresh the login statistics.

4G IIoT RTU

8.5.4 Cellular Usage

Go to **Status > Statistics & Reports > Cellular Usage** tab.

Cellular Usage screen shows data usage statistics for the selected cellular interface. The cellular data usage can be accumulated per hour or per day.
